Deliberate eutrophication has long existed as a practice in fish culture. Fish are the last, and perhaps least, affected by eutrophication; their variability in spatial distribution, growth, food habits, and survival make assessment of eutrophication effects difficult. This is offset somewhat by available statistics on population dynamics, by availability of physiological data, and by public interest. Nutrient-rich pollutants and their high oxygen demand affect fish directly, often lethally, at all life stages. High concentrations of decay-produced carbon dioxide adversely influence respiration; sedimentation and fungal growths adversely affect food organisms and spawning substrates. Sublethal effects may be more serious factors in population survival; these include sensory impairment, tissue degeneration, organ malfunction, changes in endocrine balance, and alterations in competitive success. Early stages of eutrophication may enhance growth, later stages may force changes in food habits and spatial distribution. Eutrophication has induced changes in yield and species composition of fish populations. The degree of advantage gained from eutrophication depends on better knowledge of processes involved in eutrophication and diversion of now-wasted nutrients into controlled culture processes. SOME ASPECTS OF FEEDING IN ZOOPLANKTON,
Michigan Univ., Ann Arbor.
George W. Saunders, Jr.
Eutrophication: Causes, Consequences, Correctives, Printing and Publishing Office, National Academy of Sciences, Washington D C, 1969, p 556-573. 2 fig, 5 tab, 33 ref.

Descriptors: *Feeding rates, *Zooplankton, Physiological ecology, Nutrition, Aquatic bacteria, Detritus, Organic matter, Kinetics, Radioisotopes, Daphnia, Food webs, Copepods, Environmental effects, Carbon radioisotopes, Michigan, Temperature, Phytoplankton, Biomass, Water pollution effects, Eutrophication.
Identifiers: *Trophic ecology, Cyclops bicuspidatus, Filtering rates, Frains Lake (Mich), Carbon-14, Ceriodaphnia, Bosmina, Nauplius, Tropocyclops, Keratella, Conochiloides, Codonella, Douglas Lake (Mich), Lancaster Lake (Mich), Nigger Creek (Mich), Assimilation.

A general system of zooplankton feeding is presented. The food system may be viewed as a buffered system. In lakes with little organic detritus, zooplankton depend primarily on phytoplankton. Detritus and bacteria provide an important food supply only during terminal phases of major phytoplankton blooms--providing a lightly-buffered system. Where organic detritus is at high concentrations, detritus may occupy a dominant role, together with phytoplankton, in zooplankton feeding. This system is highly buffered as sharp changes in concentrations of one food source are compensated. Bacteria generally have their major role in mineralization processes rather than as a food source, although certain conditions (decay of algal blooms) transpose them to an important food. Information on zooplankton feeding is confusing; discrepancies may be due to studying portions of systems or analyzing different systems. It is possible to determine filtering rates and analyze zooplankton feeding systems in nature; which may be easier than synthesizing such systems in the laboratory. Tabular data include estimates of total carbon assimilation by zooplankton under natural conditions. (See Vol. 3, No. 10, Field 5C, W70-03975). (Voigtlander-Wisconsin)

ALGAL NUTRITION AND EUTROPHICATION,
Haskins Labs., New York.
Luigi Provasoli.
Eutrophication: Causes, Consequences, Correctives, Printing and Publishing Office, National Academy of Sciences, Washington, D C, 1969, p 574-593. 2 fig, 3 tab, 72 ref.

Descriptors: *Eutrophication, *Algae, *Nutrients, Nitrogen, Phosphorus, Sodium, Potassium, Trace metals, Vitamins, Water pollution, Physiological ecology, Diatoms, Oligotrophy, Cyanophyta, Chlorophyta, Great Lakes, Bioindicators, Fish, Washington, Lakes, Indiana, Ochromonas, Phytoplankton, Seaweeds.
Identifiers: *Algal nutrition, Ditylum, Chaetoceros, Skeletonema, Thalassiosira, Coccolithus, Sargasso Sea, Synura, Gymnodinium, Chemical symbiosis, Microbial ecology, Dinobryon, Volvox, Pandorina, Spirogyra, Synechococcus, Chroococcus, Oscillatoria, Nostoc, Anabaena, Anacystis, Microcystis, Bosmina, Asterionella, Melosira, Synedra, Fragilaria, Ceratium, Sweden, Aphanizomenon, Rhodomonas, Cryptomonads, Chrysomonads, Euglenids, Dinoflagellates.

Prevalent emphasis on nitrogen and phosphorus notwithstanding, little doubt exists that other nutrients play roles in eutrophication of natural waters. Also, accent is on aspects of biological overproduction in eutrophication, whereas more visible manifestations are changes in community structure, producing less desirable species via alterations in food chains. From these viewpoints, unfortunately little is known regarding ecologically important species. Selected nutritional aspects of algae are reviewed as regards nitrogen, phosphorus, sodium, potassium, trace metals, vitamins, and chemical symbiosis. In some situations, growth of chlorophytes (green algae) are favored by high concentrations of nitrogen, phosphorus, and potassium. Where chlorophytes are replaced, nitrogen-fixing blue-green algae may take over because nitrogen is too scarce to meet requirements of chlorophytes. It is known that both sodium and potassium increase during eutrophication. Such changes may be functional as well as indicative of eutrophication. Although trace elements are of acknowledged significance in algal nutrition, few reliable ecological data are available, and additional research is required. Vitamins are likely to be rich in eutrophic environments, a matter of importance since 197 of 204 algal species studied require vitamins, and since a pattern of vitamin requirements is beginning to emerge for various taxonomic groups. (See Vol. 3, No. 10, Field 5C, W70-03975). (Eichhorn-Wisconsin)
W70-04503

AGRICULTURAL DRAINAGE AND EUTROPHICATION,
Wisconsin Univ., Madison.
J. W. Biggar, and R. B. Corey.
Eutrophication: Causes, Consequences, Correctives, Printing and Publishing Office, National Academy of Sciences, Washington, d c, 1969. p 404-445, 8 fig, 14 tab, 69 ref.

Descriptors: *Agricultural watershed, *Subsurface drainage, *Drainage, *Eutrophication, Nitrogen, Phosphorus, Surface waters, Percolation, Suspended load, Groundwater, Aquifer characteristics.
Identifiers: *Agricultural drainage, Dissolved nutrients, Water mixing, Russian River (Calif), Yakima Basin (Pacific Northwest), Lake Mendota (Wis).

A comprehensive review of numerous aspects involved in the relationship of agricultural drainage and water eutrophication is presented. Particular attention is given to chemical reactions that nitrogen and phosphorus undergo in soil-water system. The fate of nutrients transported by surface runoff, interflow, and deep percolating water is determined by complex coinfluencing factors, such as nature of suspended material, heterogeny of soil profile, and degree of water mixing. Stress is placed on the inapplicability of macro-parameters, such as average hydraulic conductivity, to processes occurring on a microscopic scale. The report includes illustrations of plant nutrient loss from harvested areas and contributions of fertilizing elements from agricultural lands. An appraisal of agricultural drainage influence on eutrophication requires investigations of chemical and mineralogical contents of runoff waters in different seasons, dynamics of groundwater, and water in the unsaturated zone below root systems. (See Vol. 3, No. 10, Field 5C, W70-03975). (Wilde-Wisconsin)
W70-04504

NUTRIENT OUTPUT FROM MANAGED FORESTS,
Michigan Univ., Ann Arbor.
Charles F. Cooper.
Eutrophication: Causes, Consequences, Correctives, Printing and Publishing Office, National Academy of Sciences, Washington, DC, p 446-463, 1969. 3 tab, 39 ref.

Descriptors: *Riparian land, *Forests, *Forest fires, *Forest soils, Eutrophication, Ecosystems,

Nutrients, Runoff, Seepage, Subsurface flow, Stream gages, Lysimeters, Environmental sanitation, Fertilization, Statistical models, Estimating, Stochastic processes, Clear-cutting.
Identifiers: Forest hydrochemistry, Watershed input-output, Forest fertilization, Thin-film water dynamics.

Under undisturbed conditions, well stocked forest stands make very small contribution to eutrophication of natural waters, retaining nearly all input of phosphorus and nitrogen. However, a reduction in the density of stands and especially clear cuts, promotes the release of soluble nutrients and their discharge by an increased surface runoff and subsurface flow. Fertilization of forest stands may undesirably increase eutrophication of lakes and streams, especially when aerial broadcast includes water basins and riparian zones. Fish kills and other detrimental effects of eutrophication were recorded as consequences of forest fires followed by torrential rains. A great threat to forest lakes is presented by human wastes contributed directly by the vacationists and by seepage of septic tanks. (See Vol. 3, No. 10, Field 5C, W70-03975). (Wilde-Wisconsin)

ALGAE AND METROPOLITAN WASTES.
Public Health Service, Cincinnati, Ohio. Div. of Water Supply and Pollution Control; and Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio.

Transactions of seminar on Algae and Metropolitan Wastes held at Cincinnati, Ohio, April 27-29, 1960, sponsored by Div of Water Supply and Pollution Control and the Robert A Taft Sanitary Engineering Center. Bartsch, Alfred F, Chairman. Robert A Taft Sanitary Engineering Center, SEC TR W61-3, 1961. 162 p.

Descriptors: *Conferences, *Eutrophication, *Algae, Planning, Rivers, Lakes, Limnology, Wisconsin, Urbanization, Connecticut, Oregon, Washington, Primary productivity, Ecosystems, Illinois, Phosphorus, Drainage, Agricultural watersheds, Nitrogen fixation, Cyanophyta, Sewage effluents, Minnesota, Water pollution effects, Algicides, Water quality.
Identifiers: *Urban wastes, Madison (Wis), Lake Zoar (Conn), Klamath Lake (Ore), Lake Washington (Wash), Algal nutrition, Algal physiology, Heterotrophy, Micronutrients, Badfish River (Wis), Detroit Lakes (Minn), Nutrient removal, Mass communication.

In April 1960, a seminar met in Cincinnati, Ohio, to consider the problem, Algae and Metropolitan Wastes. The meeting, of which this volume constitutes the recorded transactions, was sponsored by Division of Water Supply and Pollution Control and Robert A Taft Sanitary Engineering Center, both agencies of the US Public Health Service. Discussions at the seminar were limited to prevention and control of objectionable algal blooms arising from enrichment of the hydrosphere by urban and other wastes. The conference was organized into panel discussions as follows: Statement of the Problem, Growth Characteristics of Algae, Sources of Nutrients, Methods of Prevention or Control. Topical coverage of sections, with number of contributions to each recorded in parentheses, will indicate scope and coverage of meeting: introduction (1); specific problems in lakes (4), and in rivers (1); algal nutrition (3); measurement of productivity (2); land drainage (2); wastes (1); limnological relationships (3); nutrient limitation (6); algicide use (1). The volume includes a summation of research needs and text of a banquet address by a journalist on theme of communication between scientist and layman. (See also W70-04507). (Eichhorn-Wisconsin)

BIOLOGICAL PROBLEMS IN WATER POLLUTION.

Tarzwell, Clarence M (editor). Third seminar, 1962. Robert A Taft Sanitary Engineering Center, Cincinnati, Ohio, Public Health Service Publication No 999-WP-25, 1965. 424 p.

Descriptors: *Conferences, *Water pollution, *Aquatic environments, Shrimp, Crabs, Tubificids, Water quality, Bioindicators, Bioassays, Environmental effects, Ohio, Phytoplankton, Eutrophication, Aquatic insects, Invertebrates, Fish, Wildlife, Radioisotopes, Food chains, Toxicity, Organic pesticides, Fish diseases, Fish parasites, Fishkill, Diatoms, Cyanophyta, Aquatic bacteria, Protozoa, Crustaceans, Mollusks, Lakes, Rivers, Copper, Cesium, Dissolved oxygen, Effluents, Columbia River, Land use, Agricultural wastes.
Identifiers: *Water quality criteria, Italy, Marine environments, Freshwater environments, Cincinnati (Ohio), US Public Health Service, Microbial ecology, Zinc, Thermal effects.

This volume records proceedings of Third Seminar on Biological Problems in Water Pollution. Held in August 1962 at Robert A Taft Sanitary Engineering Center, Cincinnati, Ohio, it was sponsored by Research Branch, Division of Water Supply and Pollution Control, US Public Health Service. Seminar's theme was water quality criteria for aquatic life. Organized into sections, with numbers of individual contributions to each recorded in parentheses, sectional topics reflect report's scope: value and use of water quality criteria (5); environmental requirements and effects on water quality of planktonic algae (4); environmental requirements of freshwater invertebrates (4), marine invertebrates (4), aquatic insects (5), fishes and wildlife (8); concentration by aquatic organisms of radionuclides, their passage through food chains and potential effects (4); bioindicators of pollution (3); detection, measurement, toxicity of organic pesticides (5); relationships of land use to hydrosphere (3); control of fish diseases and parasites (2); causes of fishkills (2); artificial eutrophication of hydrosphere (2); safe levels of pollutants and toxicants in hydrosphere (12). Publication includes summary, and text of address--Role of the Aquatic Biologist in the Federal Water Pollution Control Program, by James M Quigley, then Assistant Secretary of US Department of Health, Education, and Welfare. (See also W70-04509 and W70-04510). (Eichhorn-Wisconsin)

THE EUTROPHICATION OF LAKES AND RIVERS, CAUSE AND PREVENTION,
Zurich Univ. (Switzerland). Cantonal Lab.
Eugene A. Thomas.
Third seminar, 1962. Biological Problems in Water Pollution, Robert A Taft Sanitary Engineering Center, Cincinnati, Ohio, Public Health Service Publication No 999-WP-25, p 299-305, 1965. 24 ref.

Descriptors: *Lakes, *Rivers, *Sewage effluent, Water quality control, Nitrogen, Phosphorus, Lake morphology, Color, Turbidity, Dissolved oxygen, Biological treatment, Aquatic plants, Aesthetics, Fishing harvest, Aeration, Cyanophyta.
Identifiers: *Artificial eutrophication, *Phosphorus removal, Sources of pollution, Mechanical treatment, Coregonen, Cladophora, Spirogyra, Ulothrix, Reeds, Oscillatoria limosa, Hydrodictyon reticulatum, Lake Zurich (Switzerland), Circular drainage systems, Plant removal, Chemical treatment, Pumping hypolimnion.

The consequences of sewage added to lakes and rivers is discussed together with the necessary conditions for permanent improvement of waters. Over-enrichment of lakes and rivers occurs by means of sewage effluents even after mechanical and biological purification. Thorough removal of phosphates from sewage as a direct measure against eutrophication is proposed. Other deterrents of eutrophication are prevention of sewage discharge to lakes through circular drainage systems, intensive development of fishing, plant removal, chemical treatment of waters, aeration of deep waters, drawing off deep waters in lakes, and introducing fresh water to deoxygenated waters. (See W70-04508). (Ketelle-Wisconsin)

ALGAE AS INDICATORS OF POLLUTION,
Academy of Natural Sciences of Philadelphia, Pa. Dept. of Limnology.
Ruth Patrick.
Third seminar, 1962. Biological Problems in Water Pollution, Robert A Taft Sanitary Engineering Center, Cincinnati, Ohio, Public Health Service Publication No 999-WP-25, p 225-231, 1965. 4 fig, 1 tab, 33 ref.

Descriptors: *Algae, *Bioindicators, *Water pollution, Diatoms, Maryland, Pennsylvania, Rivers, Streams, Euglena, Aquatic populations, Eutrophication, Cyanophyta, Sewage effluents, Chlorophyta, Rhodophyta, Physiological ecology, Industrial wastes, Hydrogen ion concentration, Iron compounds, Hydrogen sulfide, Lead, Copper, Ammonia, Conductivity, Chromium, Phenols, Nitrogen, Calcium, Dissolved oxygen.
Identifiers: Community structure, Ridley Creek (Pa), Nobs Creek (Md), Back River (Md), Oscillatoria, Catherwood diatometer, Savannah River, Population dynamics, Algal communities, Microbial ecology, Water quality criteria, Cyanide, Naphthenic acid.

Extensive literature has developed regarding algal indicators of pollution. Pollution concept refers to various physical and chemical changes in the hydrosphere produced by human activities. Earliest recognizable form of pollution resulted from organic contamination, and species were classified according to degrees of organic pollution they tolerated. Little attention was focused on population dynamics of various species or on holistic aspects of algal communities. Because of increasing diversity and complexity of pollutional loads and because environment strongly affects their occurrence and population size, assessing pollution by presence or absence of a few species is inclined to be misleading. Thus, well established populations of several algal species may indicate presence of particular forms of pollution, but their elimination or decrease may result from causes very different than changes in pollutional load. Because algal communities integrate effects of influencing factors, more recent study of pollution has been directed to consider structure of the entire algal community as indicative of pollution. Examples are cited of several such approaches, considering various forms of pollution at a number of different localities. Discussion following the paper developed information that Euglena and Oscillatoria are often cited as genera most tolerant to sewage and related conditions. (See W70-04508). (Eichhorn-Wisconsin)

5D. Waste Treatment Processes

PROGRESS AND DEVELOPMENTS IN TREATMENT OF INTEGRATED TEXTILE MILL WASTES,
Colorado State Univ., Fort Collins. Natural Resources Center.
T. A. Alspaugh.
Proceedings 12th Southern Municipal Industrial Waste Conference, North Carolina State Univ, Raleigh, NC, p 46-62, 1964.

Descriptors: *Activated sludge, *Biochemical oxygen demand, *Color, Waste water treatment, Treatment facilities, Aeration, Lagoons, Domestic wastes, Sedimentation, Chlorination, Sludge, Detergents, Spraying, Algae, Centrifugation, Filtration, Anerobic digestion, Incineration, Iron compounds, Sulfates.
Identifiers: *Anti-foam agents, *Textile wastes, Fiber wastes, Dyeing wastes.

A full-scale plant was constructed to treat 21 mil. gal. per week by the 24-hour high-solids activated-sludge process in which the longer aeration period and the higher solids concentrate in the aeration tank both assist in removing the highly-soluble biochemical oxygen demand of textile waste waters, buffering shock loads, and providing efficient treatment as regards removal of color. The textile waste waters pass through two storage lagoons in series (to provide equalization and some removal of lint and dye paste) and are mixed with 10% of screened and degritted domestic sewage before entry into the aeration tank. After final sedimentation the effluent is chlorinated and reacrated before discharge to a creek. Operating data are tabulated showing an average biochemical oxygen demand removal of 89-90% and color removal of 50-75%. The problem of foaming is accentuated by the high concentrate of synthetic detergents in textile waste waters; the most successful treatment methods are spraying with crude waste water, alone or with the addition of anti-foaming agent on to the rotor blades, and possibly the removal and destruction of foam by a vacuum pump. The poorly-settling sludge was found to contain heavy growths of algae. The problem could be overcome by allowing the sludge to become septic before return to the aeration tank, or by introducing a shock load of organic algae. However, these algae have good characteristics for removal of biochemical oxygen demand and color. Excess sludge from the treatment of textile waste waters is difficult to settle and concentrate. Rates of vacuum filtration and centrifugation are low compared with sewage sludge. At present the sludge is discharged to the municipal sewer. Other promising methods of disposal appear to be vacuum filtration and centrifugation. (Livengood-North Carolina State Univ)

NUTRIENT REMOVAL FROM CANNERY WASTES BY SPRAY IRRIGATION OF GRASSLAND,
Robert S. Kerr Water Research Center, Ada, Okla.
James P. Law, Jr., R. E. Thomas, and Leon H. Myers.
Available from the Clearinghouse as PB-189 774, $3.00 in paper copy, $0.65 in microfiche. FWPCA Water Pollution Control Research Series 16080...11/69, Nov 1969. 73 p, 23 tab, 8 fig, 18 ref, 3 append.

Descriptors: *Wastewater treatment, *Soil disposal fields, *Canneries, Industrial wastes, Pollution abatement, Hydrologic aspects, Water conservation.
Identifiers: *Grassland irrigation, *Soil treatment system, Spray-runoff, Cannery waste water, Nutrient removal.

The Campbell Soup Company plant at Paris, Texas, treats wastewater from the processing operations by spraying onto grassland. Vegetable solids and grease residues are separated and recovered. A comprehensive 12-month study was conducted to determine treatment efficiencies of the spray-runoff treatment system. A total of 133 inches of wastewater was applied to four experimental areas during the study period. Hydrological measurements, chemical removal efficiencies, and changes in soil properties were evaluated in relation to years of wastewater application, soil type, and spray schedule. Hydrological measurements accounted for 93 percent of the total liquid applied and showed that evaporative losses accounted for 18 percent of the total liquid applied; runoff accounted for 61 percent. During periods of heavy rainfall, runoff increased to a maximum of 80 percent of the total applied liquid. The results showed that the system achieved mass removals of 92 to 99 percent of the volatile solids and oxygen-demanding substances, 86 to 93 percent of total nitrogen, and 50 to 65 percent of phosphorus. Soil textural class and system age had very little effect on treatment efficiencies. Evaluation of surface and subsoil samples and soil water at the 3-foot depth indicated an increase in salinity with age, but nitrogen and phosphorus remained low. Much of the phosphorus removed from the wastewater was found in the surface soil layer.

DISSOLVED-AIR TREATMENT OF COMBINED SEWER OVERFLOWS, A DEMONSTRATION PROJECT OF A PROTOTYPE TREATMENT PLANT DESIGNED TO TREAT WASTES FOUND AT A COMBINED SEWER OVERFLOW.
Rhodes Technology Corp., Houston, Tex.

Available from the Clearinghouse as PB-189 775, $3.00 in paper copy, $0.65 in microfiche. Federal Water Pollution Control Administration, Research Series, WP20-17, Jan 1970. 216 p, 17 tab, 17 fig, 22 ref, 5 append. FWPCA Program 11020 FKI. Contract No 14-12-11.

Descriptors: *Combined sewers, Storm water, *Overflows, *Dissolved-air flotation, Infiltration, Treatment methods, Primary treatment, Flocculant aide, Suspended solids, Storm runoff.

A dissolved-air flotation system was evaluated for primary treatment of combined sewer overflows. The major pieces of component equipment were a gyratory screen, hydrocyclones, an air dissolving tank, and a flotation cell. The principal aspects investigated were: (1) Performance of the system during rain events and dry periods; (2) Evaluation of individual components; (3) Capital costs and operating costs for utilizing a flotation system for various size combined sewage overflows; (4) The adaptability of the system for automation and use in remote location; and (5) The ability of the system to treat intermittent and highly variable flows from combined sewage systems. Some chemical aids to flocculation were also tested. The system performed comparably to conventional clarifiers. It appears dissolved-air flotation systems would be economical for handling combined sewer overflows up to 8 MGD. Automation of dissolved-air flotation systems appears possible with conventional control equipment. Chemical aids to flocculation appear to have promise that warrants further study. The system was unique in that all liquid flow passed directly through the air dissolving tank with no recycle. Domestic sewage was studied in lieu of combined sewage during periods of no rain. Conclusions, recommendations, and benefit-cost relationships are presented in the report. A description of the demonstration plant and of the drainage area served by the flotation system are appended.

SEWERAGE AND SEWAGE DISPOSAL IN COLD REGIONS,
Army Terrestrial Sciences Center, Hanover, N.H.
Amos J. Alter.
Available from the Clearinghouse as AD-698 452, $3.00 in paper copy, $0.65 in microfiche. Cold Regions Services Engineering Monograph III-C5b, Oct 1969. 110 p. DA Project 1T062112A130.

Descriptors: Frost protection, Lagoons (Ponds), Sewage, *Sewage disposal, *Sewage treatment, Sewers, Utilities (Cold regions), *Waste disposal.

The main items dealt with in this monograph of 106 pages are: Practice and problems, Collection and transport, Treatment and processes, Thermology, Re-use and regenerative processes, and Construction and operation. There are 225 references, 54 illustrations, and 18 tables. Six appendixes treat stabilization ponds, ventilation of buildings having sewage treatment plant, solid wastes, and other topics.
W70-04064

BIOLOGICAL TREATMENT OF HIGHLY-ALKALINE TEXTILE MILL WASTE-SEWAGE MIXTURE.
Proceedings American Society Civil Engineers, Vol 81, No 750, p 750-1--750-4, 1955.

Descriptors: *Biological treatment, *Waste water (Pollution), *Sewage, Alkalinity, Sedimentation, Biochemical Oxygen Demand, Color, Hydrogen Ion Concentration.
Identifiers: *Textile wastes, Percolating filters.

Pilot-plant studies were made on the biological treatment of a mixture of textile manufacture waste waters and sewage on percolating filters, without previous neutralization of the high alkalinity. The waste waters, with a pH value of 10.5, were mixed with sewage in the proportion of 4 percent waste water to 96 percent sewage, the amount of waste water gradually increased to 40 percent, and the mixture applied to the experimental filter at a BOD loading of 2.73 lbs/sq.yd. Examination of the filter effluent showed a reduction in BOD of 51 percent, and in color of 42.5 percent; the pH value was 9.1. A total reduction in BOD of 58 percent was obtained after final sedimentation. (Livengood-North Carolina State Univ)

BIOLOGICAL TREATMENT OF INDUSTRIAL EFFLUENTS,
N. Blakebrough.
International Dyer, Textile Printer, Bleacher, and Finisher, Vol 135, p 909-911, 1966.

Descriptors: *Biological treatment, *Domestic wastes, *Biochemical oxygen demand, *Treatment facilities, Industrial wastes, Economics, Flow rates, Aeration, Trickling filters, Microorganisms, Organic matter.
Identifiers: Lubeck process.

The Lubeck Process for the biological treatment of wastes sprays effluent tangentially above the surface of a circular aeration tank. (Spraying aerates waste faster and supresses the tendency to foam). The offtake in the center bottom of the tank gives a spiral flow. Air jets and tank construction provide a rolling circulation transverse to the direction of bulk flow; together these flows keep the floc well mixed and suspended. From the aeration tank the effluent goes to a settling tank. The process handles shock loads by diluting through the system and by speeding up the cycling of sludge and liquors. Removal of biochemical oxygen demand is between 88 and 98%. For a given duty, the aeration tank volume for the Lubeck process may be 1/4 to 1/10 that of a conventional plant. Total power requirements for the process are usually between 0.2 - 0.3 kw-hr. per pound of biochemical oxygen demand. (Sheffield - North Carolina State Univ)

METHODOLOGY OF THE ORIENTATION TEST FOR THE AMENABILITY OF WASTE WATERS TO PURIFICATION BY THE ACTIVATED-SLUDGE PROCESS (Czechoslovakian),
A. Borovickova, and V. Zahradka.
Sbornik Vysoke Skoly Chemicko-technologicke v Praze, Vol 8, No 1, p 393-416, 1964.

Descriptors: *Activated sludge, *Biochemical oxygen demand, Industrial wastes, Aerobic bacteria, Microorganisms, Sewage, Copper, Chromium, Phenol, Cotton.
Identifiers: *Dyeing wastes, Warbur-respirometer, Toxicity, Cyanides.

After a comparative review of methods for assessing the effect of trade waste waters (or their toxic constituents) on the aerobic micro-organisms involved in the treatment of municipal sewage by the activated sludge process, the authors describe and explain a direct manometric method developed at the Hydraulic Research Institute, Prague, and based on determination of the oxygen demand in the given substrate using an apparatus of the Warburg-respirometer type. The method and formulae used for calculating the results are explained and experiments showing the effect of copper and hexavalent chromium on the BOD curve for synthetic

municipal sewage and the effects of syanide on the curve for phenolic waste waters. Further studies were also made with cotton-dyeing waste waters and with a mixture of municipal sewage and spent sulphite liquor. In all cases results were confirmed by tests in a laboratory-scale activated-sludge plant. It was concluded that the manometric method gives reproducible biochemical results and indicates objectively the toxicity of the test material towards the aerobic microorganisms. (Livengood-North Carolina State Univ)

FINISHING CHEMICALS FOR KNIT GOODS: SHOULD THEY REALLY BE BIODEGRADABLE,
Fancourt (W. F.) Co., Greensboro, N.C.
R. H. Beaumont.
American Dyestuff Reporter, Vol 54, p P667-P668, 1965.

Descriptors: *Biodegredation, *Biological Oxygen Demand, *Surfactant, Standards, Soaps, Foaming, Bacteria, Detergents.
Identifiers: *Finishing wastes, Knitted fabrics, Textile chemicals.

When an industry empties effluent directly into a stream the replacement of branched-chain detergents with new straight-chain detergents will not produce a low bacterial oxygen demand or reduce the foam problem in the immediate vicinity of the plant. The surfactant that this industry needs is one that decomposes quickly but only to the extent of losing its foam-producing power. If the effluent passes through a treatment system, biodegradables are desirable. The new biodegradable detergents will not behave identically to the non-biodegradable ones in many industrial processes, and adjustments are sometimes necessary. The price of biodegradables is about equal to that of non-biodegradable materials. (Sheffield-North Carolina State University)

DISPOSAL OF WASTES FROM WATER TREATMENT PLANTS.

Am Water Wks Ass'n J, Vol 61, No 11, p 619-638, Nov 1969. 20 p.

Descriptors: *Waste water treatment, *Water treatment, *Waste disposal, *Waste water disposal, Brine disposal, Ultimate disposal, Environmental engineering, Sanitary engineering, Sludge disposal, Lagoons, Water Quality Act, Waste water (Pollution), Sludge treatment, Reclaimed water, Water reuse, Water pollution treatment, Environmental sanitation, Filtration, Oxidation lagoons, Coagulation, Industrial wastes, Municipal wastes, Water softening, Treatment facilities, Water quality control.
Identifiers: *Filter washwater.

A status report on water treatment plant operation is presented. Because of recent federal action and stricter state regulations applying to the discharge of water treatment plant wastes into surface streams, the disposal of such wastes poses a problem of plant operation. Alum coagulant sludge is the prime type of waste produced by water treatment plants. Plant operations for disposal of alum and other coagulant wastes include direct discharge to surface waters, lagooning, discharge to sanitary sewers, freezing, centrifuging, vacuum filtration, sand bed and wedge wire drying, filter pressing, barging to sea, pipeline transportation, and alum recovery. The advantages and disadvantages of each method of disposal are discussed. Filter washwater can be disposed of by treatment and recovery. Methods for disposal of softening plant sludges are generally similar to those used for the disposal of alum sludges. No significant advancements have been made in methods for disposal of the spent brines from cation-exchange softening operations. Ten techniques needed to solve the problem of waste disposal from water treatment plants are suggested. A status report on regulatory aspects of plant waste disposal and a summary of the survey of state regulatory agencies by the American Water Works Association Research Foundation are presented. (Powell-Florida)

THE BIOCHEMICAL OXYGEN DEMAND OF TEXTILE CHEMICALS: UPDATED LIST 1966.

American Dyestuff Reporter, Vol 55, No. 18, p 685-688, 1966. 9 ref.

Descriptors: *Biochemical Oxygen Demand, Bio Degredation, Test Procedures.
Identifiers: *Textile Chemicals, Chemical Composition.

Textile chemicals are listed and five-day BOD is given, as determined by the Winkler (Azide Modification) Method found in the 'Standard Methods for the Examination of Water, Sewage, and Industrial Wastes' published by the American Public Health Association. The values are given as percents based on the weight of the chemical as received. The composition and use of each chemical is given. The BOD test is used as an index of pollution and is a good method for the measurement of complete biological decomposition into such compounds as carbon dioxide and water. BIOLOGICAL MEASUREMENT OF WATER POLLUTION,
Beak (T. W.) Consultants Ltd., Collins Bay (Ontario).
T. W. Beak.
Chemical Engineering Progress, Vol 60, No 1, p 39-43, 1964. 5 fig, 10 ref.

Descriptors: *Waste water (Pollution), Water analysis, Measurements, Biology, Microorganisms, Biological properties.

Basic to the biological measurement of pollution is the normal aquatic community with sensitive and tolerant plants and animals in equilibrium. When pollution enters the environment, a degree of change in species composition occurs proportional to the degree of environmental change; the most sensitive species are eliminated first, with tolerant species remaining. The non-numerical nature of biological data has hindered its use in measuring pollution. Two methods are given for putting biological data into a quantitative form. The Biological Score Method establishes normal distribution on control waters and assigns a maximum number of points. Polluted streams are then judged and given a lower number of points in proportion to the amount of pollution present. Scores can be equated to various uses, and differences between two sides of a river or up and down stream can be shown on one chart. The Bivariate Chart Method depends on statistical analysis of biological data on aquatic animal communities to make control charts for detecting significant change in the community and monitoring pollution. TREATMENT OF MIXTURES OF TEXTILE WASTE AND DOMESTIC SEWAGE,
Cone Mills Corp., Greensboro, N. C.
R. H. Souther, and T. A. Alspaugh.
American Dyestuff Reporter, Vol 47, No 14, p 480-488, 490, 1958. 1 fig, 18 ref, 18 tab.

Descriptors: *Domestic wastes, *Biochemical oxygen demand, Water pollution control, Waste disposal, Cotton, Coagulation, Biological treatment, Hydrogen-ion concentration, Trickling filters, Standards, Toxicity, Waste water treatment.
Identifiers: *Souring waste, *Slashing wastes, *Desizing wastes, *Bleaching wastes, Finishing wastes, Mercerizing wastes, Starch, Wool, Sodium carboxymethylcellulose, Sodium hydroxide.

The treatment of textile waste has long been considered a difficult problem due to variability, strength, and alkaline nature of the waste. Many consultants in the past have stated that combined treatment with sewage was not feasible without expensive chemical pretreatment, and therefore, separate treatment recommendations have prevailed. This paper is a discussion of research at Cone Mills to evaluate combined treatment against separate treatment with and without pretreatment. The methods investigated include physical, chemical, and biological processes, particularly the effect of lagooning as an aid to waste treatment. Conclusions indicate that biological treatment of combined textile waste and domestic sewage without chemical pretreatment is practical and economical. Lagooning can be expected to reduce both initial cost and operating expenses. (Sheffield-North Carolina State Univ)

TREATMENT OF INDUSTRIAL WASTES IN THE UNITED STATES,
Purdue Univ., Lafayette, Ind.
Don E. Bloodgood.
Institute of Sewage Purification Journal and Proceedings, Pt 4, p 359-370, 1958. 14 ref.

Descriptors: *Legislation, *Standards, *Radioactive wastes, *Incineration, Phenol industrial wastes, Lagoons.
Identifiers: Waste water treatment, Recovery (Wastes).

The methods of government control in handling of industrial wastes are listed for the federal government, groups of states that have agreed upon compacts, state governments, sanitary districts or other subdivisions of local communities, and municipal governments. 'Model ordinance' specifications for

municipalities are given. Some assisting agencies and symposia are named. Finally, the following waste problems and disposal methods are discussed: (1) underground disposal, (2) refinery wastes, (3) spray and ridge and furrow irrigation of wastes, (4) phenol recovery, (5) incineration of solid cyanide wastes, (6) metal-plating wastes disposal, (7) low stream flow augmentation, (8) industrial re-use of water, (9) circulating lagoons, (10) methods of dealing with radioactive wastes, and (11) a proposed method for recovery of solids from solutions, especially waste liquors and sludges. POLLUTION CONTROL OF NEW ENGLAND INTERSTATE WATERS,
Joseph C. Knox.
American Dyestuff Reporter, Vol 47, No 14, p 477-479, 491, 1958. 2 tab, 4 ref.

Descriptors: *Domestic wastes, *Biochemical Oxygen Demand, Water Pollution Control, Waste disposal, Cotton, Coagulation, Biological treatment, Hydrogen-ion concentration, Trickling filters, Standards, Toxicity, Waste water treatment.
Identifiers: *Scouring waste, *Slashing wastes, *Desizing wastes, *Bleaching wastes, Finishing wastes, Mercerizing wastes, Starch, Wool, Sodium carboxymethylcellulose, Sodium hydroxide.

The New England Interstate Water Pollution Control Commission administers a compact of seven states for the control of water pollution in the interstate inland and tidal waters of the area. The compact is based on a system of classification of waters according to proposed highest use, with physical, chemical and bacteriological standards established for each class. Commission research showed the textile industry to be the largest contributor of wastes. Textile pollution comes from two sources: natural impurities, highest in woolen mills, and process chemicals. In most plants chemicals account for 80% of BOD, but chemical substitution can often eliminate 50%-90% of this. The paper outlines the criteria used in classification of streams under commission control. (Sheffield-North Carolina State Univ)

COMBINED TREATMENT - BLEACHERY WASTE AND DOMESTIC SEWAGE,
Cannon Mills Co., Kannapolis, N.C.
John L. Brown, Jr.
American Dyestuff Reporter, Vol 47, No 14, p 489-490, 1958. 1 ref.

Descriptors: *Domestic wastes, *Biochemical Oxygen Demand, Water Pollution Control, Waste disposal, Cotton, Coagulation, Biological treatment, Hydrogen-ion concentration, Trickling filters, Standards, Toxicity, Waste water treatment.
Identifiers: *Scouring waste, *Slashing wastes, *Desizing wastes, *Bleaching wastes, Finishing wastes, Mercerizing wastes, Starch, Wool, Sodium carboxymethylcellulose, Sodium hydroxide.

Cannon Mills Company segregates waste into starches, caustic wastes, and general wastes. The first two contribute most to pollution and are treated; general wastes are by-passed. Treatment involves (1) segregation, (2) storing caustic wastes, (3) treating waste through a conventional two-stage, high-rate trickling filter plant, and (4) chlorination. The storage lagoon for caustic wastes enables pH control through the plant on a seven-day basis: converts 65% of the hydroxide alkalinity to carbonate or bicarbonate, and reduces BOD 15%. Starch wastes are settled separately, and lime is added to prevent fermentation. Domestic sewage and slasher waste enter the caustic wastes in primary settling tanks, where remaining alkalinity is removed. Four fans blow under the drain system of the filters, eliminating odor and increasing filter efficiency 30%. Chlorine is added at up to 3000 pounds per day, depending on stream condition. Sludge is removed from digestors weekly. The plant treats 60% textile waste and 40% domestic sewage; the operator can control flow rates, pH, and biological load. LABORATORY STUDIES ON THE REMOVAL OF PHOSPHATES FROM SEWAGE BY THE COAGULATION PROCESS,
Norsk Institutt for Vannforskning, Blindern.
Arne Henriksen.
Schweizerische Zeitschrift fur Hydrologie, Vol 24, p 253-271, 1962. 9 fig, 1 tab, 19 ref.

Descriptors: *Sewage, *Sewage treatment, Hydrogen ion concentration, Phosphates, Phosphorus compounds, Coagulation, Detergents.
Identifiers: Orthophosphates, Polyphosphates, Hydrolyzable phosphate, Aluminum sulfate, Ferric sulfate, Molar capacity, Langmuir adsorption isotherm.

Removal of phosphates from sewage by coagulation was accomplished in an apparatus similar to that designed by Packham. Samples of settled sewage of pH 7.8, containing 11.45 milligram/liter phosphate as orthophosphate and 5.75 milligram/liter phosphate as hydrolyzable phosphate, were coagulated with 50 and 200 ppm aluminum sulfate and 40 and 200 ppm ferric sulfate. After filtration the samples were analyzed for orthophosphates. Using aluminum sulfate, an effective removal of orthophosphates was obtained at the pH range 6.0-7.1; the corresponding range with ferric sulfate was 4.7-7.4. Trials with different concentrations of chemicals and addition of acetic acid indicated that ferric sulfate is a more efficient coagulant, especially applicable to hydrolyzable phosphates. A significant part of the latter is represented by polyphosphates from synthetic detergents. Under conditions of these trials, polyphosphates appear to be more vulnerable to removal than orthophosphates. (Wilde-Wisconsin)

REGENERATION OF SPENT GRANULAR ACTIVATED CARBON,
MSA Research Corp., Callery, Pa.
A. J. Juhola, and F. Teppar.
Available from the Clearinghouse as PB-189 955, $3.00 in paper copy, $0.65 in microfiche. Robert A. Taft Water Research Center Report No TWRC-7 Federal Water Pollution Control Administration, Feb 1969. 91 p, 18 fig, 28 tab, 5 ref, 2 append. FWPCA Project 11020...2/69. Contract No 14-12-107.

Descriptors: *Activated carbon, *Tertiary treatment, *Treatment facilities, Waste water treatment, Water purification, Research and development.
Identifiers: Activated carbon regeneration.

The regeneration of spent granular activated carbon, used in tertiary treatment of municipal waste water, is a three-step process, (1) drying, (2) baking and (3) activating. Laboratory studies with an indirect heated rotary tube furnace demonstrated that the rates at which the drying and baking steps are performed do not have a significant effect on the properties of the baked carbon. The controlling step for the regeneration product is the activation, and the important parameters are the carbon temperature, length of activating time, and steam or carbon dioxide concentration in the activating gas mixture. In multiple hearth furnace regenerations, where the reported carbon losses are 5% to 7% per regeneration, the characteristics of the activating step are: (1) high activating gas input rate, (2) relative short activating time, and (3) relatively low carbon temperature. Thermodynamic calculations made on the hearth furnace regeneration indicate that, by performing only the activation of a previously baked carbon, the hearth furnace gas input rate can be reduced drastically and to the point where it approaches the optimum rate of the rotary tube. (Knapp-USGS)
W70-04297

COST AND PERFORMANCE ESTIMATES FOR TERTIARY WASTEWATER TREATING PROCESSES,
Robert A. Taft Water Research Center, Cincinnati, Ohio.
Robert Smith, and Walter F. McMichael.
Available from the Clearinghouse as PB-189 953, $3.00 in paper copy, $0.65 in microfiche. Robert A. Taft Water Research Center Report No TWRC-9, Federal Water Pollution Control Administration, June 1969. 27 p, 7 fig, 6 tab, 5 ref. FWPCA Project 17090...6/69.

Descriptors: *Tertiary treatment, *Water costs, *Cost analysis, *Performance, Activated carbon, Oxidation, Filtration, Sewage treatment, Waste treatment, Water pollution control.
Identifiers: Lime clarification, Ammonia stripping, Microscreening.

Generalized estimates of both performance and cost are presented for wastewater treatment processes which can be used with activated sludge process to reduce the pollution load on the receiving stream. Processes and groups of processes believed to be leading candidates for use downstream of secondary treatment are listed. Data from various sources on the fraction of 5-day BOD associated with suspended solids are tabulated. Microscreening or rapid sand filtration removes about 42% of the 5-day BOD and 21% of the COD and TOC. Other solids-removing processes, such as lime clarification, multimedia filtration, and granular carbon adsorption, remove a greater fraction of the suspended solids. Some of the dissolved organic contaminants might be removed, but this appears to be negligible. A large fraction of the dissolved organic species is removed by granular carbon adsorption. Estimates of the concentrations of BOD, COD, TOC, nitrogen, and phosphorus downstream of each group of processes are tabulated. Estimated capital and operating and maintenance costs for each process are shown. (Knapp-USGS)

ARTIFICIAL-RECHARGE EXPERIMENTS UTILIZING RENOVATED SEWAGE-PLANT EFFLUENT - A FEASIBILITY STUDY AT BAY PARK, NEW YORK, U.S.A.,
Geological Survey, Mineola, N.Y.
Philip Cohen, and C. N. Durfor.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 193-199, 1967. 7 p, 4 fig, 3 ref.

Descriptors: *Artificial recharge, *Recharge wells, *Water reuse, *New York, *Saline water intrusion, On-site tests, Tertiary treatment, Filters, Groundwater movement, Injection wells, Observation wells, Costs.
Identifiers: Long Island (NY), Barrier injection wells.

The U.S. Geological Survey, in cooperation with the Nassau County Department of Public Works, is conducting a series of artificial-recharge experiments on Long Island, New York to obtain scientific and economic data needed to evaluate the feasibility of injecting highly treated sewage-plant effluent into a proposed network of 'barrier' injection wells that are intended to prevent or retard the landward movement of salty water from the Atlantic Ocean into major aquifers. Tertiary sewage treatment was developed to produce an effluent that meets requirements commonly accepted for potability. An experimental injection well and injection plant have been completed. Remote sensing downhole geochemical probes permit the measure-

ment of water-quality and hydraulic-head changes at several points within the injection well and the filterpack. (Knapp-USGS)

METHOD FOR THE REMOVAL OF SOLUBLE PHOSPHATES IN WASTE WATER TREATMENT,
Allied Chemical Corp., New York.
John C. Eck, and William C. Zegel.
US Patent 3,453,207, July 1, 1969, 5 p. 1 tab, 2 ref.

Descriptors: *Waste water treatment, *Phosphates, *Cation exchange, Emulsifiers, Patents.
Identifiers: *Alum, Soluble phosphates, Synthetic cationic organic latex, Polymerization, Olefins, Dienes, Halogen, Copolymerization.

This invention relates to precipitation of dissolved phosphate ion in water by a combination of alum and a cationic organic latex followed by separation of the substantially free water from the phosphate-containing precipitate. 'Synthetic cationic organic latex' contemplates a water based emulsion formed by a free radical emulsion polymerization of 2-carbon to 30-carbon olefins, 4-carbon to 30-carbon dienes and halogen, ester or aryl substituted olefins or dienes of the above chain length or mixtures thereof with each other in water and a cationic organic emulsifying agent. Only limitation imposed is that resultant polymer or copolymer must be water soluble. Preferable compounds for the preparation of the lattices along with several illustrative examples are described. Data from 17 runs indicates that treatment of wastewater by the simultaneous addition of 10 ppm of a variety of lattices and 40 ppm of alum is as effective at removing dissolved phosphate as treatment with 150 ppm of alum alone. Treatment of wastewater with cationic latex effects essentially no phosphate removal. Treatment with 40 or 50 ppm of alum alone is significantly less effective than treatment with the synergistic combination of 40 ppm of alum and 10 ppm of latex. (Haskins-Wisconsin)

DISPOSAL OF LIQUID WASTES BY INJECTION UNDERGROUND - NEITHER MYTH NOR MILLENNIUM,
Geological Survey, Carmel, Calif.
Arthur M. Piper.
Report available at no cost from US Geological Survey, Wash, DC 20242. Geological Survey Circular 631, 1969. 15 p, 2 tab, 94 ref.

Descriptors: *Waste disposal, *Injection wells, *Well regulations, Aquifers, Water quality, Earthquakes, Water storage, Water pollution sources, Water pollution control, Surveys, Legislation, Legal aspects, Economics, Regulation, Administrative agencies, Management.
Identifiers: Waste disposal wells.

Injecting liquid wastes deep underground is an attractive but not necessarily practical means for disposing of them. For decades, impressive volumes of unwanted oil-field brine have been injected, currently about 10,000 acre-feet yearly. Recently, liquid industrial wastes are being injected in ever-increasing quantity. Effects of deep injection are complex and not all are understood clearly. In a responsible society, injection cannot be allowed to put wastes out of mind. Injection is no more than storage--for all time in the case of the most intractable wastes--in underground space of which little is attainable in some areas and which is exhaustible in most areas. Standards by which to categorize the wastes are urgently desirable. To the end that injection may be planned and administered, there is proposed an immediate and comprehensive canvass of all the United States. Such a canvass would consider (1) natural zones of groundwater circulation, from rapid to stagnant, (2) regional hydrodynamics, (3) safe injection pressures, and (4) geochemical aspects. Only Missouri, Ohio, and Texas have statutes specifically to regulate injection of industrial wastes. Some new, fully competent institutional arrangement appears to be essential, under a unified policy. (Knapp-USGS)

REGIONAL CONSTRUCTION REQUIREMENTS FOR WATER AND WASTEWATER FACILITIES.
Business and Defense Services Administration, Washington, D.C.

Available from the US Dept of Commerce, Wash, DC, 20230, price - $0.25. US Department of Commerce, Business and Defense Services Administration, Oct 1967. 35 p, 22 fig, 18 tab, 7 map, 9 ref.

Descriptors: *Water supply, *Waste water (Pollution), *Waste water treatment, *Costs, Construction, Water quality, Construction costs, Installation costs, Maintenance costs, Replacement costs, Obsolescence.
Identifiers: *Water facilities, *Wastewater facilities.

The purpose of this report is to serve as a guide and to assist manufacturers in planning their future production and sales programs. It can also be used to advantage by construction contractors, consulting engineers and federal, state and local planners. This study provides historical data of construction put in place in actual dollars from 1955 through 1966, and a projection of requirements in 1966 dollars from 1967 through 1980. Since World War II the increase in population, with its attendant tremendous urban expansion accompanied by population shifts in the United States, has stimulated a greater demand for public water and wastewater facilities. At 1966 prices, an estimated $66.3 billion must be spent on construction of water ($28.8 billion) and wastewater facilities ($37.5 billion) during the 14-year period 1967-1980. This sum is required to remedy present deficiencies, to make up for obsolescence and depreciation, and to meet increased requirements of a growing population. The increase in water usage and wastewater discharge will require an average annual expenditure at $4.7 billion for the 14-year period for water and wastewater facilities ($2.0 billion and $2.7 billion respectively). This is an increase of approximately 139% of the annual average expenditure over the past 12 years. (Davis-Chicago)

GRAVITY FILTRATION OF ALGAL SUSPENSIONS,
Ontario Water Resources Commission, Toronto. Div. of Research.
R. H. G. Andrews.
Ontario Water Resources Commission, Division of Research Publication No 21, Aug 1968. 41 p, 22 fig, 6 tab.

Descriptors: *Water, *Filters, *Algae, Nuisance algae, Intakes, Sands, Flow rates, Turbidity, Chlorella, Scenedesmus, Euglena.
Identifiers: *Water supplies, Green algae, Head losses, Oocistus, Filtration media, Anthracite, Gravity filters.

This study was concerned with effectiveness of different filter media preventing the clogging of water supplies by algae: Chlorella, Scenedesmus, Oocistus, and Euglena. The dual-media and anthracite filters proved comparatively most effective, but their maximum retention was only 50% of Euglena and 18% of other algae. There was no consistent effect of the rate of flow on algae removed. The use of nephelometric turbidimeter failed to provide a significant correlation between algae counts and recorded turbidities. The conclusion is that gravity filters alone should not be considered for removal of algae from raw water supplies. (Wilde-Wisconsin)

POLICE AND HEALTH REGULATIONS OF FOURTH CLASS CITIES.

Mo Ann Stat secs 79.380, 79.390 (1952), as amended, (Supp 1970).

Descriptors: *Missouri, *Cities, *Public health, *Diseases, Legislation, Local governments, Parks, Condemnation, Regulation, Water works, Hospitals, Sewers, Conduits, Outlets, Channels, Channel improvement, Wells, Reservoirs, Well regulations, Well permits, Reservoir management, Water supply, Cisterns, Water pollution, Diversion, Obstruction to flow.

The board of aldermen of fourth class cities may make regulations and enact ordinances for the prevention and abatement of contagious diseases within the city. Quarantine laws may be enforced within five miles of the city. The board may purchase or condemn all necessary lands within ten miles of the city for hospital purposes, waterworks, and sewer carriage and outfall. The police jurisdiction of the city shall extend over such land to the same extent as over other city property. The board may establish, alter, and change the channel of watercourses, wall them and cover them over, and prevent obstructions thereon. They may establish and regulate public wells, cisterns, and water reservoirs. They may provide for the filling of such water reservoirs. (Schram-Florida)

ARTIFICIAL RECHARGE FOR PUBLIC WATER SUPPLIES IN URBANIZED REGIONS,
Technische Hogeschool, Delft (Netherlands). Dept. of Sanitary Engineering.
L. Huisman.

Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 200-212, 1967. 13 p, 17 fig, 2 tab.

Descriptors: *Artificial recharge, *Municipal water, *Water storage, *Water quality, Water treatment, Filtration, Public health, Water purification, Water resources, Water spreading, Aquifers, Permeability, Porosity.
Identifiers: *Netherlands.

Artificial recharge is applied to transform surface water with varying characteristics into groundwater of more constant quality, which will be safe for public supply. The utmost stress is put on the removal of bacteriological pollution, for which purpose the recharge and recovery works are designed and operated in such a way as to avoid short-circuiting as much as possible. This results in a more or less constant detention period for all the water abstracted and consequently variations in physical and chemical characteristics of the raw water are propagated with little or no damping. Input variation, as well as fluctuation in water temperature, could be smoothed out by a different design of the artificial recharge system, promoting a strong variation in detention time and -- if necessary -- even accepting short-circuiting. A few suggestions are given for possible solutions. As an example, the use of water from the River Rhine for public drinking water supplies in the Netherlands is considered. (Knapp-USGS)
W70-04356

CHICAGO'S SOUTH DISTRICT FILTRATION PLANT.
Department of Water and Sewers, Chicago, Ill.

Chicago, City of Chicago Department of Water and Sewers, 1961. 29 p, 25 fig, 3 tab.

Descriptors: *Water treatment, *Water purification, *Filtration, *Filters, *Water supply, *Water works, *Treatment facilities, Chemical precipitation, Coagulation, Chlorination, Sedimentation, Ammonification, Activated carbon, Construction, Construction materials, Construction costs, Intakes, Tunnels.
Identifiers: *Chicago Water Department, *Chicago's South District Filtration Plant.

The publication describes the design, construction and operation of Chicago's South District Filtration Plant which went into full operation in 1947. The plant, located at Lake Michigan near East 79th St., serves about 1,600,000 persons in a 162 Sq. Mi. area. Two raw water intakes are provided--one crib intake located 2 miles offshore, and a direct intake at the lake end of the plant. Water entering the crib intake is conveyed by 14 Ft. and 16 Ft. diameter tunnels located 140 Ft. below lake level. A breakwater was built to protect plant structures from wave action, and a watertight bulkhead was built around the plant area. The mixing and settling basins are of two-story construction. A portion of the filtered water storage is located below the filters. The treatment process consists of prechlorination, addition of activated carbon, coagulation with aluminum sulfate or ferrous sulfate, fluoridation, sedimentation, filtration, and postchlorination with ammoniation. Maximum plant capacity is 640 mgd; 1960 average was 365 mgd. Construction cost, including engineering and supervision, was $27,052,932. One hundred seventy two employees are used to operate the plant. (Poertner-Chicago)

PRODUCTION OF CHANNEL CATFISH (ICTALURUS PUNCTATUS) IN TERTIARY TREATMENT PONDS,
Iowa State Univ., Ames. Dept. of Zoology and Entomology.
Thomas G. Huggins, and Roger W. Bachmann.
Available from the Clearinghouse as PB-190 165, $3.00 in paper copy, $0.65 in microfiche. Iowa State Water Resources Research Institute, Completion Report Project No A-017-IA, June 1969. 119 p, 21 fig, 38 tab, 35 ref. OWRR Project A-017-IA.

Descriptors: *Channel catfish, *Tertiary treatment, *Ponds, Water quality, Temperature, Light penetration, Dissolved oxygen, Ammonia, Nitrates, Nitrites, Phosphates, Chemical oxygen demand, Biochemical oxygen demand, Phytoplankton, Zooplankton, Benthic fauna, Hydrogen ion concentration, Ammonia, Diurnal distribution, Chlorophyll, Chlamydomonas, Chlorella, Copepods, Rotifers, Tubificids, Pollution abatement, Stocking, Midges, Seasonal, Depth, Chemical analysis, Scenedesmus, Euglena, Ochromonas, Nematodes, Mites, Insects.
Identifiers: *Ictalurus punctatus, Ames (Iowa), Ankistrodesmus, Pandorina, Cladocerans, Physa halei, Chironomids, Glyptotendipes barbipes, Chlorogonium, Actinastrum, Golenkinia, Kirchneriella, Micractinium, Oocystis, Pediastrum, Chroomonas, Cryptomonas, Navicula, Nitzschia, Glossiphoniidae, Palpomyia.

A series of four tertiary treatment ponds, studied for water quality improvement and channel catfish production, provided data on water temperature, light penetration, dissolved oxygen, ammonia, nitrate, nitrite, ortho phosphate, chemical oxygen demand, biochemical oxygen demand, phytoplankton, zooplankton, benthic fauna and channel catfish. Thermal and chemical stratification disappeared after installation of an aeration system. Average reduction in nitrate and nitrite concentration from the plant effluent to pond IV was 27% during the 1967 winter and 70% during the 1968 summer. During the 1967 winter a slight increase in ortho phosphate concentration was recorded from treatment plant effluent to pond IV but during the 1968 summer there was a reduction of 48%. Dominant genera were usually Chlamydomonas, Ankistrodesmus, Chlorella, and Pandorina in pond IV. Average concentration of chlorophyll a in ponds III and IV was similar both summers but in ponds I and II much less for the 1968 summer. Cladoceran populations were greater in pond I during the 1968 summer than during the 1967 summer. Chironomids were the dominant organisms in benthos. During the 1967 summer, catfish grew well in ponds III and IV. Catfish survival, growth and production progressively increased from pond I to pond IV. (Jones-Wisconsin)

IMPOUNDMENT DESTRATIFICATION FOR RAW WATER QUALITY CONTROL USING EITHER MECHANICAL OR DIFFUSED AIR PUMPING,
Federal Water Pollution Control Administration, Cincinnati, Ohio.
J. M. Symons, W. H. Irwin, E. L. Robinson, and G. G. Robeck.
J. American Water Works Assoc., Vol 59, No 10, p 1268-1291, October 1967. 20 fig., 5 tab., 19 ref.

Descriptors: *Thermal stratification, *Aeration, *Impoundments, *Reservoirs, *Mixing, *Water quality control, Water quality, Water pollution, Nitrogen, Phosphorus, Air, Phytoplankton, Algae, Efficiencies, Dissolved oxygen, Oxygen, Lakes.

Two methods are compared for artificially destratifying lakes and reservoirs both of which broke up the thermal stratifications pattern in the lakes successfully and improved water qualities. Other conclusions reached were that multiple mixing started in the spring will maintain good quality water in an impoundment, and is superior to a single mixing in midsummer or early fall. Some rise in nitrogen and phosphorus concentrations occurred in surface water during destratification, but the surface population of phytoplankton and the phytoplankton standing crop declined during mixing. Algal populations increased again when mixing stopped. Data taken in this study and from 5 other studies in the literature showed a destratification efficiency ranging from 0.1 to 1.2%, and averaging 0.5%; and an energy input/unit of impoundment water volume ranging from 0.7 to 4.9 kw-hr/acre ft and averaging 2 kw-hr/acre-ft. (Novotny-Vanderbilt)

5G. Water Quality Control

PROJECTS OF THE INDUSTRIAL POLLUTION CONTROL (BRANCH FEDERAL WATER POLLUTION CONTROL ADMINISTRATION),
Federal Water Pollution Control Administration, Washington, D.C.
William J. Lacy.
Available from the Clearinghouse as PB 189 766, $3.00 in paper copy, $0.65 in microfiche. Up-dated version of report with same title of August 1969 (See Vol 3, No 6, W70-02885). FWPCA Water Pollution Control Research Report, Jan 1970. 167 p, 9 tab, 4 fig. FWPCA Project 12000---01/70

Descriptors: *Industrial water, *Water pollution control, Wastewater treatment, *Water reuse, *Water pollution treatment, Industries, Water quality, Water requirement.
Identifiers: Industrial pollution control.

The objective of the industrial pollution control R and D program is to develop and demonstrate the required technology to achieve required degrees of pollution control by lease cost methods for all significant industrial sources of pollution. This report includes summaries of 150 research, development, and demonstration efforts necessary to resolve industrial pollution problems. A total of 1200 program efforts are listed in tabular presentation. These projects include the latest developments in physical, chemical, biological and combinations of treatment methods. It is expected to develop further the cooperation of industry to participate in meaningful pollution abatement demonstrations and to increasingly demonstrate the feasibility of in-plant measures, by-product recovery, and wastewater reuse as methods to abate pollution and to reduce treatment costs. Research through in-house efforts and by contracts to industries and universities are to complete state of the art studies related to treatment and control technology for selected industry groups. Research through in-house efforts and by contracts to industries and universities are to complete state of the art studies related to treatment and control technology for selected industry groups. Industrial wastewaters are to be identified, characterized, quantitized, and classified for all industries of pollutional significance.

WATER QUALITY MANAGEMENT, FIRST ANNUAL REPORT FOR PERIOD ENDING JUNE 30, 1969.
Miami Conservancy District, Dayton, Ohio.

Miami Conservancy District First Annual Report of Water Quality Management, Aug 1969. 97 p, 31 fig, 5 exhibit, 17 tab, 44 ref.

Descriptors: *Water pollution control, *Ohio, Water quality act, Aesthetics, Water quality, Water pollution treatment, Monitoring, Planning, Water management (Applied).
Identifiers: *Miami River (Ohio).

The programs and activities of the Miami Conservancy District are described. The purpose of the District's program is to provide for the evaluation of regional water quality in the Great Miami River basin and for the development of regional programs which will enhance and protect the water and related land resources of the basin. Activities being carried out are the formation and utilization of advisory groups, the establishment and operation of a network for monitoring regional stream water quality, and the evaluation of various approaches to improving water quality, such as stream aeration and low-flow augmentation. The plan also provides for continuing surveillance of stream conditions with appropriate notice to individuals and organizations responsible for activities which degrade stream appearance. Reaches of stream which are maintained by The Miami Conservancy District for flood control purposes are receiving more intensive care directed to improving the appearance of the river channels. (Knapp-USGS)

ACID MINE-DRAINAGE PROBLEM OF THE PATOKA RIVER WATERSHED, SOUTHWESTERN INDIANA,
Indiana Univ., Bloomington.
Don M. Corbett.
Water Resources Research Center Report of Investigations No 4, Indiana University, Oct 1969. 173 p, 4 fig, 2 plate, 4 tab, 10 ref.

Descriptors: *Acid mine water, *Indiana, Water pollution sources, Water pollution control, Water pollution treatment, Acidic water, Neutralization, Data collections, Water quality, Leaching, Sulfates, Chlorides.
Identifiers: Patoka River, Pike County (Ind).

Sources of acid in the Patoka River Watershed, Indiana, were identified and the effect this acid had on the water quality of the Patoka River was determined. The economic development of Pike County and adjacent areas has been stymied for more than 30 years because of an inadequate supply of good quality water. The Patoka River (below the mouth of the South Fork Patoka River during periods of low flow, is too acidic for domestic use. Treatment would be beyond the financial resources of the local economy. Of the 20,000 acres of cast overburden groundwater aquifers in Pike County, less than 4,000 acres produce acidic water. The remaining 16,000 acres produce nonacidic water, most of which is high in sulfate, and in some instances, high in chloride. The acid mine-drainage problem of this area is a creation of past mining operations for coal. Acid contributions from storm runoff are usually many times greater than those from sustained flow, and most generally originate in the compacted 5 to 10% of the areas disturbed by surface mining that accelerate runoff. Stabilization of acidic flows at a reduced level, by eliminating flushout of pollutants in the South Fork Patoka River Watershed, would make feasible the treatment of 5,000,000 gpd. (Knapp-USGS)

INVESTIGATION OF SOME METHODS FOR INCREASING THE DIGESTIBILITY IN VITRO OF MICROALGAE,
Royal Inst. of Tech., Stockholm (Sweden). Div. of Applied Biochemistry.
Gudmund Hedenskog, Lennart Enebo, Jitka Vendlova, and Bohumir Prokes.
Biotechnology and Bioengineering, Vol 11, No 1, p 37-51, 1969. 6 fig, 4 tab, 18 ref.

Descriptors: *Algae, *Microorganisms, Scenedesmus, Proteins, Walls, Structure, Amino acids, Mechanical equipment, Enzymes, Chemical degradation, Vitamins, Cellulose, Chlorella, Peptides, Bacteria, Snails, Weight, Vacuum drying, Boiling.
Identifiers: *Digestibility, *In vitro, In vivo, Ball-mill, Meicelase, Hydrogen peroxide, Rats, Trypsin, Scenedesmus quadricauda, Scenedesmus obliquus, Helix pomatia, Chlorella pyrenoidosa, Nitrogen utilization, Roller drying, Spray-dried, Glass beads, Trichoderma, Disintegration.

To increase availability of cell bound protein in Scenedesmus algae, mechanical, enzymatic, and chemical methods of degrading the cell wall structure were investigated. Mechanical treatment involved the use of a ball-mill; algae suspension together with glass beads was milled in a water-cooled chamber equipped with rotating disks. The chemical test included a cellulolytic enzyme (Meicelase) employing hydrogen peroxide. Using batches in the ball-mill experiments a complete disintegration was achieved in a disintegrator. Trials were also performed with a continuous disintegrator and dependence of disintegration on bead size and flow rate studied. Disintegration determined by microscopic cell count was compared to increase of pepsin digestibility. The Meicelase treatment caused a slight increase of pepsin digestibility, measured after 3 hour pepsin incubation. No increase of pepsin digestibility was detected with hydrogen peroxide treatment. After the ball-mill disintegration, 95% of contaminating bacteria were killed and yields of extractable proteins were higher. Capacity of available continuous ball-mills is such that they could be used on a pilot-plant scale and energy cost of disintegration would be of the same magnitude as that of separation. A BOUNTY ON WATER POLLUTERS,
A. R. Roalman.
Water Resources Bulletin, Vol 5, No 2, p 62-65, June 1969. 4 p, 1 ref.

Descriptors: *Water resources development, *Legislation, *Water pollution control, *Pollution abatement, Rivers and Harbors Act, Harbors, Navigable waters, Legal aspects, Government, Water pollution sources, Non-structural alternatives, Environmental sanitation, Remedies.

The Harbor Act of June 29, 1888, as amended on June 7, 1924, could be the most powerful pollution control law on the books. It provides a way for any private citizen to bring an action against almost any water polluter. It includes a stiff fine and a jail sentence for the polluter. It also provides a bounty for the citizen who proves his case. A congressman and a group of New York conservationists have invoked the act in a suit against the Penn-Central Railroad charging pollution of the Hudson River. The Secretary of the Army and the Corps of Engineers of the United States Army are responsible for enforcing the law. The Act originally covered New York Harbor and Long Island Sound. Later amendments expanded it to cover waterways flowing into the Atlantic and the Gulf of Mexico. The most recent amendment extended coverage to the outflow waters of the United States. One contention is that all the navigable waters of the United States are included. The Act strictly forbids the placing, discharging, or depositing, by any process or manner, of refuse, dirt, ashes, cinders, mud, sand, dredgings, sludge, acid, or any other matter of any kind other than that flowing from streets, sewers, and passing therefrom in a liquid state. Another portion of the Act concerns pollution caused by oil spills from ships. (Powell-Florida)

ESTABLISHMENT OF MUNICIPAL SEWER SYSTEMS.
Mo Ann Stat secs 88.832 thru 88.852 (Supp 1970).

Descriptors: *Missouri, *Sewers, *Sewage disposal, *Local governments, Legal aspects, Political aspects, Cities, Sewage, Sewage treatment, Waste water disposal, Wastes, Municipal wastes, Domestic wastes, Municipal water, Environmental sanitation, Treatment facilities, Taxes, Legislation.

Any municipality may establish a general sewer system composed of public, private, district, and joint district sewers. Public sewers shall be established along principal courses of drainage. The municipality may levy a 'special public sewer tax' on all taxable property within the city to pay for construction and maintenance of sewers. District sewers may be established and connected to public sewers upon petition of a majority of the landowners in the district or when the municipality deems such sewer necessary for sanitary reasons. The municipality shall levy a tax apportioning the cost of district sewers among the pieces of ground in the district. Joint district sewers may be established when the municipality deems a sewer in an area encompassing more than one district to be necessary. The municipality may regulate construction of private sewers and shall assume none of the cost thereof. The municipality may condemn and purchase property for construction of sewers. When no bids are offered for sewer construction the city may construct a sewer. (Dye-Florida)

WATER POLLUTION.
Mo Ann Stat secs 204.010 thru 204.180 (1962), as amended, (Supp 1970).

Descriptors: *Missouri, *Water pollution, *Water pollution control, *Administrative agencies, Legislation, Public health, Environmental sanitation, Impaired water quality, Pollution abatement, Pollutants, Pollutant identification, Reasonable use, Riparian rights, Standards, Wastes, Industrial wastes, Sewage, Water pollution treatment, Fish, Wildlife, Recreation, Agriculture, Permits, Water pollution sources, Administrative decisions, Legal aspects.

The state policy toward water pollution is detailed. Pollution is defined as the discharging of sewage or wastes into the state's water so as to make them impure, odorous, detrimental to public health, harmful to fish or wildlife, or detrimental to agricultural, industrial, recreational, or other reasonable uses. Causing pollution is declared a public nuisance and made unlawful. Permits are required prior to discharging sewage or wastes into the state's waters. The Water Pollution Board is authorized to grant and revoke such permits. The Board shall supply technical and scientific information to polluters to aid in eliminating pollution. Hearings and judicial review of Board actions relating to permits are provided. The organization of the Water Pollution Board is outlined. The Board is required to: (1) make surveys to determine the extent of pollution within the state; (2) prepare plans to reduce pollution and prevent further pollutions; (3) establish standards of water purity; and (4) administer the enforcement of pollution laws. The Board may conduct research, cooperate with government agencies, and enter agreements to prevent and control pollution. The Board may investigate violations, institute legal proceedings, make inspections, and represent the state. The powers of drainage and levee districts and the rights of action are not affected by this act. (Schram-Florida)

SETTING WATER QUALITY STANDARDS AND REGULATING NUTRIENT SOURCES,
Minnesota Pollution Control Agency, Minneapolis.

John P. Badalich.
Water Pollution by Nutrients--Sources, Effects and Control, Water Resources Research Center, University of Minnesota, Minneapolis, WRRC Bulletin 13, p 64-72, June 1969.

Descriptors: *Nutrients, *Regulation, Nitrogen, Phosphorus, Water quality control, Waste treatment, Water quality, Minnesota, Eutrophication.
Identifiers: *Nutrient sources, Stream standards, Effluent standards, Stream uses, US Public Health Service, Water quality standards, Areal nutrient sources.

The definition of an acceptable water quality standard is thought to have instigated all the discussion of standards in the past few years. Basis and methodology for establishing water quality standards for Minnesota are discussed. Application of water quality standards in Minnesota is discussed in terms of stream and effluent standards; specific standards are presented. Regulation of nutrient sources is summarized in terms of point sources and areal runoffs. Areal and agricultural runoff contributes the major portion of nutrients. Nuisance blooms of algae are possible at a phosphorus concentration of 0.01 milligram/liter and 0.3 milligram/liter of nitrogen. Minnesota has a phosphorus standard of 1 milligram/liter, which is considered a temporary economically attainable limit for the present, rather than a protective limit. (See W70-04266). W70-04277

EFFECT OF DESASPIDIN AND DCMU ON PHOTOKINESIS OF BLUE-GREEN ALGAE,
Marburg Univ. (West Germany). Dept. of Botany.
W. Nultsch.
Photochemistry and Photobiology, Vol 10, No 2, p 119-123, 1969. 2 fig, 2 tab, 15 ref.

Descriptors: *Cyanophyta, *Light, *Kinetics, Anaerobic conditions, Argon, Photosynthesis, Air, Light quality, Cycles.
Identifiers: *Desaspidin, *DCMU, Phormidium uncinatum, Phosphorylation, Ferricyanide, Electron transport, ATP, Dark, Phycocyanin, Acceleration, Glycolysis, Carbon dioxide-fixation, Phycoerythrin.

Photokinesis (light accelerated movement) is the result of an increased ATP supply of photosynthetic phosphorylation, whereas movement in the dark is supported by ATP produced by oxidative phosphorylation and, to a minute extent, by anaerobic-phosphorylation coupled with glycolysis. Movement speed may be used to measure the activities of phosphorylation processes within the living cell. Effect of desaspidin and DCMU (3-(3,4-dichlorophenyl-1, 1-dimethylurea) on movement speed in light and dark of the blue-green algae Phormidium uncinatum has been investigated. Desaspidin, which uncouples oxidative phosphorylation and predominantly cyclic photosynthetic phosphorylation, inhibits movement in the dark as well as light, but dark movement is more sensitive. Movement in light is more sensitive under anaerobic conditions than in air. Inhibitory effect of desaspidin is markedly increased by DCMU, which inhibits non-cyclic electron transport and coupled phosphorylation in air as well as under argon. There is no evidence of any photodestruction of desaspidin in air, provided no ferricyanide is present in the medium. These findings are interpreted to confirm the concept of photokinesis and that both cyclic and non-cyclic photophosphorylations supply energy for the movement in blue-green algae. (Jones-Wisconsin)
W70-04293

FACTORS AFFECTING THE USE OF MONOMOLECULAR SURFACE FILMS TO CONTROL OIL POLLUTION ON WATER,
Naval Research Lab., Washington, D.C.
William D. Garrett, and William R. Barger.
Environmental Science and Technology, Vol 4, No 2, p 123-127, Feb 1970. 5 p, 4 fig, 3 tab, 17 ref.

Descriptors: *Water pollution control, *Monomolecular films, *Oily water, Water chemistry, Water properties, Water quality, Surfactants, Thin films, Films, Alcohols.
Identifiers: Oil pollution control.

Under suitable conditions, monomolecular surface films may be used to confine oily pollution on water. Since these materials spread spontaneously into one-molecule-thick layers, very small quantities can be used to treat large surface areas. The surface-chemical characteristics of several potential pollutants were studied to determine their behavior at the air/water interface. A number of monolayer-forming materials with varying surface-chemical properties were examined for their ability to survive at an air/water interface and contain oil films. The following monolayer properties relevant to oil pollution control were determined: the monolayer spreading velocity, the ability to resist and spread against wind, and the thickness of an oil lens supportable by a particular monolayer. Optimum characteristics were demonstrated by 'liquid' water-insoluble monolayers with high film pressures and low oil solubility. Surface films with high spreading pressures will compress thinly spread layers of pollutant oil to lenses 0.5-1.0 cm thick, substantially reducing the area covered by pollution. (Knapp-USGS)
W70-04305

ACID MINE DRAINAGE IN APPALACHIA.
Appalachian Regional Commission, Washington, D.C.

Appalachian Regional Commission Report, 1969. 126 p, 4 fig, 10 plate, 37 tab.

Descriptors: *Acid mine water, *Appalachian Mountain Region, *Data collections, *Surveys, Hydrologic data, Water chemistry, Water quality, Hydrogeology, Water pollution sources, Water pollution effects, Water pollution control, Recreation, Navigation, Water sources, Ecology, Economics.
Identifiers: Acid mine drainage data.

Over the last 100 years, coal mining in the Appalachian Region has caused increased amounts of acid, sediment, sulfates, iron, manganese, and hardness in the Region's streams, thus substantially altering water quality in approximately 10,500 miles of streams,primarily in the northern half of the Region. Three-fourths of the acid streams are in the Susquehanna, Allegheny, Monongahela, Potomac, and Delaware River basins in Pennsylvania, West Virginia, and Maryland. Almost 80% of acid pollution comes from abandoned or inactive mines and over 70% originates in underground mines. Cost and extracted waste disposal considerations limit treatment technology applicable for pollution control to the neutralization processes. A concerted effort over a period of time to abate and control acid mine drainage pollution involves determining priorities, providing funding arrangements, implementing abatement programs, regulating active mining operations, continuing research and development of control and abatement techniques, and adequately considering the interests of the various public and private groups involved. Such an effort, to be successful, requires the full participation of Federal, regional, state and local levels of government as well as the private sector in the affected portions of the Region. (See also W70-04329 thru W70-04333). (Knapp-USGS)
W70-04328

THE IMPACT OF MINE DRAINAGE POLLUTION ON INDUSTRIAL WATER USERS IN APPALACHIA,
Battelle Memorial Inst., Columbus, Ohio.
Ira L. Whitman, Gerald I. Nehman, and Syed R. Qasim.
Appalachian Regional Commission Report on Acid Mine Drainage in Appalachia, Appendix A, 1969. 254 p, 21 fig, 71 tab, 5 append.

Descriptors: *Acid mine water, *Water costs, *Industrial water, *Appalachian Mountain Region, Economics, Water pollution effects, Acidity, Aesthetics, Color, Corrosion, Fouling, Water quality, Water chemistry.
Identifiers: Acid mine drainage costs, Industrial water costs.

Rivers and tributaries draining coal mine regions in Appalachia receive large volumes of acid mine-drainage pollution. The effects of acid mine drainage on industrial water users in Appalachia are discussed and the economic impacts on the region, should reductions in mine-drainage pollution be achieved, are estimated. Sixty-seven manufacturing plants were visited to obtain detailed data on industrial water use, water costs, adjustments to current levels of mine-drainage pollution, and potential savings from pollution reduction. Primary focus of the in-plant interviews included the food processing, paper, chemicals, textiles, primary metals, and stone and glass industries. The greatest savings to industry would be in operating costs, particularly in reduced costs of chemicals used for waste treatment. Other savings would result from reduced maintenance, less frequent replacement of equipment, and in a few cases, lower initial plant investment costs. It is concluded that reduction in mine-drainage pollution in Appalachia would have little impact on the economy of the region itself due to changes in water utilization by industry. Estimates of annual dollar savings to industry from mine-drainage reduction indicate that such savings are but an insignificant fraction of total industrial production costs or sales value. Industry production would not be altered in either volume or composition due to reductions in mine-drainage pollution. (See W70-04328). (Knapp-USGS)
W70-04329

ENGINEERING ECONOMIC STUDY OF MINE DRAINAGE CONTROL TECHNIQUES.
Rice (Cyrus Wm.) and Co., Pittsburgh, Pa.

Appalachian Regional Commission Report on Acid Mine Drainage in Appalachia, Appendix B, 1969. 281 p, 42 fig, 54 tab, 269 ref. ARC Contract No 69-12.

Descriptors: *Acid mine water, *Water pollution control, *Water pollution treatment, *Appalachian Mountain Region, Water costs, Water treatment, Waste water treatment, Acidic water, Iron, Sulfates, Neutralization, Reverse osmosis, Injection wells, Waste water disposal.
Identifiers: Acid mine drainage.

A series of cost curve graphs were developed to serve as a method for determining the costs of applying various techniques of controlling acid mine drainage pollution. Wherever possible, curves have been presented for changes in capital, operating, and maintenance costs where these are dependent upon the scale of application under the varying sets of general conditions characteristic of mine drainage polluted areas in the Appalachian Region. The effectiveness of each of the control techniques was studied in terms of the degree to which mine drainage pollution is controlled, and the quality characteristics of the post-technique water. The techniques in the proposed or experimental stage that offer the greatest promise and thus warrant further research and development are recommended. The recommended techniques are neutralization, reverse osmosis, streamflow regulation, deep well disposal, land reclamation, revegetation, pumping and drainage, water diversion, mine sealing, refuse treatment, and impoundment of acid water. (See W70-04328). (Knapp-USGS)
W70-04330

THE INCIDENCE AND FORMATION OF MINE DRAINAGE POLLUTION IN APPALACHIA.
Corps of Engineers, Cincinnati, Ohio. Office of Appalachian Studies; and Bureau of Mines, Pittsburgh, Pa.

Appalachian Regional Commission Report on Acid Mine Drainage in Appalachia, Appendix C, 1969. 360 p, 77 fig, 2 plate, 50 tab, 306 ref.

Descriptors: *Acid mine water, *Water pollution sources, *Appalachian Mountain Region, *Water chemistry, Acidic water, Chemical reactions, Water pollution treatment, Water quality, Multiple-purpose projects.
Identifiers: Acid mine drainage control.

Mine drainage pollution in Appalachia is generally coincidental with regions that have been or are presently being mined. The worst offending areas are in the old coal fields of West Virginia and Pennsylvania, and in a few areas of southeastern Ohio which have been stripped in recent decades. It appears that the annual acidity load has remained rather stable during the last two decades. However, the rapidly growing U.S. economy requires ever increasing amounts of energy and, at least for the next few decades, coal will provide a large percentage of the needed fuel input. Appalachian states will provide most of the coal. Without effective preventive measures, the detrimental impact of mine drainage effluent on the region's water quality will be much greater in future years. Mine drainage is a solution of mixed salts, predominately sulfates, usually containing silica and sometimes highly charged with dissolved carbon dioxide. Hydrolysis of the dissolved materials in mine drainage in streams forms acid, causing a drop in the stream's pH level. A mine drainage pollution control program should be included in a project whenever the potential benefits are seriously inhibited without abatement. (See W70-04328). (Knapp-USGS)
W70-04331

THE IMPACTS OF MINE DRAINAGE POLLUTION ON LOCATION DECISIONS OF MANUFACTURING INDUSTRY IN APPALACHIA.
Fanus Co., Inc., New York.

Appalachian Regional Commission Report on Acid Mine Drainage in Appalachia, Appendix D, 1969. 317 p, append. ARC Contract No 68-50.

Descriptors: *Acid mine water, *Economics, *Water quality, *Industrial water, *Appalachian Mountain Region, Water costs, Water treatment, Water pollution treatment, Water quality control.
Identifiers: Acid mine drainage costs.

The effect of mine drainage pollution on past decisions by industrial firms to locate (or not to locate) within the Appalachian Region is discussed. Twenty case histories of plant location searches by industries that are larger-than-average users of water are compiled. Markets were an important contributory factor which eliminated Appalachia in nine of the final location decisions. Most of the industries found that abatement of acid mine pollution would have to be 90% or better to influence decisions to locate. Unfavorable location decisions are caused by poor water quality in the textile dyeing, paper, chemical, plastic, and aluminum industries. In many others, acid mine drainage pollution is not an important plant location factor. (See W70-04328). (Knapp-USGS)
W70-04332

IMPACT OF MINE DRAINAGE ON RECREATION AND STREAM ECOLOGY: APPENDIX E. MINE DRAINAGE POLLUTION AND RECREATION IN APPALACHIA.
Nathan (Robert R.) Associates, Inc., Washington, D.C.

Appalachian Regional Commission Report on Acid Mine Drainage in Appalachia, Appendix E, 1969. 114 p, 28 tab, 63 ref, 5 append.

Descriptors: *Acid mine water, *Water pollution effects, *Recreation, *Water costs, *Appalachian Mountain Region, Economics, Water pollution treatment.
Identifiers: Acid mine drainage costs.

Among the detrimental aspects of mine acid drainage is the impairment of outdoor water-based recreational activity. Mine acid pollution can inhibit and may even completely deter the use of natural waters for swimming, water-skiing, or skin-diving, and for both warm and cold water sport fishing. A study was made to estimate the magnitude of the activity loss and the resultant economic (monetary) loss which could result from a failure to abate the mine acid drainage in the polluted areas of Appalachia containing potentially recreational waters. If changes are made in water quality by various degrees of mine acid reduction, a region may be able to realize some or all of the income from the otherwise lost potential recreation expenditure. To the extent that mine acid waste abatement makes it possible to realize the increases in expenditures, these may be viewed as a schedule of opportunity benefits to which the regional income multipliers can be applied. (See W70-04333). (Knapp-USGS)

BIODEGRADABILITY OF POTENTIAL ORGANIC SUBSTITUTES FOR PHOSPHATES,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio. Cincinnati Water Research Lab.
Robert L. Bunch, and M. B. Ettinger.
Proceedings 22nd Industrial Waste Conference, Lafayette, Indiana, p 393-396, 1967. 1 fig, 14 ref.

Descriptors: *Water quality, *Eutrophication, *Detergents, *Phosphates, Chelation, Waste treatment, Aquatic algae, Aquatic plants, Testing, Biodegradation.
Identifiers: *Complexones, *Algal blooms, NTA, EDTA, HEIDA, Lake Tahoe (Calif).

The undesirable eutrophication of waters may be considerably reduced by replacing phosphates in industrial processes and detergents with biodegradable chelating agents, such as nitriloacetic acid (NTA) and hydroxyethyliminodiacetic acid (HEIDA). The use of detergents containing non-phosphate builders is suggested, especially for extreme situations, such as Lake Tahoe. The use of non-biodegradable agents which complex heavy metals will depend upon their effect on waste treatments, softening water, drinking water, and calcium metabolism of man. (Wilde-Wisconsin)
W70-04373

BRIEF TO THE INTERNATIONAL JOINT COMMISSION CONCERNING THE POLLUTION OF LAKES ERIE, ONTARIO AND THE INTERNATIONAL WATERS OF THE ST LAWRENCE RIVER,
Toronto Univ. (Ontario). Great Lakes Inst.
P. H. Jones.
University of Toronto, February 6, 1970. 12 p, 3 fig.

Descriptors: *Lake Ontario, *Lake Erie, *Great Lakes, Detergents, Phosphate, Testing.
Identifiers: St Lawrence River, Heavy duty detergent, Detergent biodegradability tests, Fish toxicity studies, Algae studies, Biodegradable detergent.

Phosphate is the critical nutrient in the fertilization of the Great Lakes, and detergents contribute 1/2 to 2/3 of the phosphates reaching waste treatment plants. A non-phosphate heavy duty laundry detergent has been developed which is comparable in cleaning effectiveness with current products, and would cost no more to produce when economies of scale are achieved. It contains nothing which would upset the natural cycle or create pollution conditions. Biodegradability studies resulted favorably. Other tests are under way. (Powers-Wisconsin)

A RIVER DIES--AND IS BORN AGAIN,
Fred J. Cook.
In: Controlling Pollution, ed. Marshall I. Goldman, Englewood Cliffs, N.J.: Prentice-Hall, Inc., 1967, p. 130-138, and New York Times Magazine, April 13, 1965.

Descriptors: *Water pollution, *Financing, *Legal aspects, *Coordination, *Sewage districts, *Sewers, *Sewage treatment, *Sewage, Estuaries, Decision making, Public health, Industrial wastes, Population, Municipal wastes, Fish, Oxygen demand.
Identifiers: *Raritan River, *Middlesex County Sewage Authority, *New Jersey State Health Department, Trunk sewer, Public relations, Compliance powers.

The Raritan River became highly polluted by World War I and was 'dead' by 1928. Under the 'New Deal' sewerage treatment plants were built to rectify this situation. A centralized system was suggested, but separate municipal plants were constructed. By 1940 these plants were obsolete. The industrial and population growth brought on by World War II were phenomenal. By 1950 the river was a controversy again. The Middlesex County Sewage Authority (MCSA) was established by the County. The MCSA had no compliance powers and cooperation was piecemeal. Weakened, the MCSA worked to gain public support. Since communities had built treatment plants only ten to fifteen years earlier, they would be reimbursed for their plant's present value when they joined the MCSA's trunk sewer and treatment system. Within six months the river began to come alive again. Although much improved, the Raritan was a disappointment. Non-MCSA municipalities and industries are to blame. Court action is planned, but will be useless unless the State Health Department is funded sufficiently to prepare a viable case. Public pressure will be necessary for this to occur. (Richmond-Chicago)

EFFLUENTS AND AFFLUENCE,
New England Interstate Water Pollution Control Compact.
Jared E. Hazelton.
In: Controlling Pollution: The Economics of a Cleaner America, ed. Marshall I. Goldman, Englewood Cliffs, N.J.: Prentice-Hall, Inc., 1967, p. 91-98, and New England Business Review, June 1965, pp. 2-9.

Descriptors: *New England Interstate WPS Compact, *Interstate compacts, *Sewage treatment, *Water zoning, *Coordination, *Classification, Water supply, Water demand, Planning, Costs, Benefits, Aesthetics, Public health, Federal government, State governments, Local governments, Flood plains.
Identifiers: *Interstate pollution, *Interstate cooperation, *Federal Water Pollution Control Act, *Restrictions, Comprehensive planning.

The river zoning approach used by the New England Interstate Water Pollution Control Compact is described. The responsibility for polluting activities is placed on both municipalities and industries. Various approaches to cleaning up the waterways are discussed: setting minimum standards; building treatment plants; and zoning. The conclusion is that it is best to make decisions on the basis of balancing costs of treatment against the benefits which various water uses bring to the community. However, minimum standards are always invoked to insure public health and aesthetic qualities. The growth of the federal role in water pollution abatement and similar state activities at the state level are discussed in light of the Federal Water Pollution Act of 1956. This legislation is reviewed in terms of its enforcement and financial assistance powers. Finally, concern is voiced that unless comprehensive interstate planning is carried out, the result of water pollution abatement and flood control programs might be the encroachment onto flood plain areas which would better serve as open space. (Richmond-Chicago)

THE GREAT AND DIRTY LAKES,
Gladwin Hill.
In: Controlling Pollution: The Economics of a Cleaner America, ed. Marshall I. Goldman, Englewood Cliffs, N.J.: Prentice-Hall, Inc., 1967, p. 43-48, and Saturday Reivew, Oct. 23, 1965.

Descriptors: *Algae, *Industrial wastes, *Municipal wastes, *Great Lakes, *Water pollution, Sewage, Aesthetics, Aerobic conditions, Anaerobic conditions, Water supply.
Identifiers: *Devolution, *Interstate pollution, *Metropolitan areas, Blondin.

The pollution of the Great Lakes is discussed. Focusing on Niagra Falls, the sources of pollution from Duluth to Buffalo are traced. Special attention is given to the Chicago and Detroit metropolitan areas. The Great Lakes are treated as one continuous system and suggests interstate pollution abatement as the only possible recourse, rejecting international efforts as cumbersome and intrastate efforts as ineffectual. While recognizing the municipal waste as a major pollution source, the author concentrates on industrial wastes from the oil, steel, paper, soap, chemical and automotive industries. He cites the Chicago and Detroit metropolitan areas as the main dischargers of ammonia nitrogen, phenols, cyanide, oil, phosphates, chlorides, suspended and settleable solids and nitrogen compound wastes into the Lakes. Chicago's efforts to maintain a usable water supply and Detroit's outdated sewage treatment facilities are also reviewed. The death of Lake Erie is treated along with a discussion of the devolution of aquatic life which accompanied it. The efforts of private individuals and conservation groups and those of various state and federal governments are treated. (Richmond-Chicago)

Industry's willingness is illustrated to take part in cooperative efforts to develop and then comply with minimum water quality standards. The importance is noted of public support, quoting Abraham Lincoln: 'Public sentiment is everything. With public sentiment nothing can fail; without it nothing can succeed.' ORSANCO's (Ohio River Valley Water Sanitation Commission) history is traced from its conception in 1935, through its inception in 1948, to its success as of 1967. Since 1948, over $1 billion has been spent to treat 99.4 per cent of the effluent discharged into the river. Ninety per cent of these funds came from local, state and industrial coffers; the federal government not being needed to solve local problems. However, the U.S. Army Corps of Engineers, the Public Health Service, the U.S.G.S. and the U.S. Weather Bureau have all contributed to the maintenance of ORSANCO's monitoring efforts. While the job is not complete, the 'oil, chemical, coal, paper, metal finishing and steel companies' have made a major contribution in the ORSANCO success story. Thermal pollution from nuclear plants is seen as a significant threat to the environment. Pleasure craft operators and nuclear plants are blamed for most of the remaining water pollution. AMINO ACID CHELATING AGENTS IN DETERGENT APPLICATIONS,
Grace (W. R.) and Co., Nashua, N.H. Hampshire Chemical Div.
Robert R. Pollard.
Soap and Chemical Specialties, Vol 42, No 9, p 58-62, 130-135, 1966. 11 fig, 2 ref.

Descriptors: *Detergents, *Soaps, *Chelation, Pollution abatement, Toxicity, Biochemical oxygen demand, Biodegradation, Phenols, Sewage treatment.
Identifiers: *Polyphosphates, Polymeric phosphates, Sodium LAS, NTA, EDTA, Chelating agents.

Toxicological studies, including rats, rabbits, and fish, as test organisms, suggested that nitrilotriacetic acid (NTA), or its trisodium salt NTATS, can advantageously replace some polyphosphates (STPP, TSPP, TKPP) in soaps and detergents. The NTATS is an alkaline material hydrolyzing in water into a weak acid and a strong base, and, in turn, possessing considerable buffering capacity. The salt does not appear to exhibit significant biochemical oxygen demand over periods up to 31 days or inhibit biodegradation of linear alkylsulphonates (LAS) and phenol biooxidation at levels of about 100 ppm. The salt does not influence factors of sewage treatment. The optimum concentration of NTA, combination of NTA with polyphosphates, effect of water hardness, the effectiveness of NTA as a builder of amino oxides and alkyl phosphonic diamides are among several aspects awaiting investigation. NATURAL RESOURCE PROTECTION THROUGH SHORELAND REGULATION: WISCONSIN,
Wisconsin Univ., Madison. Dept. of Agricultural Economics.
Douglas A. Yanggen, and Jon A. Kusler.
Land Economics, Vol 44, p 73-86, February 1968. 2 fig, 41 ref.

Descriptors: *Shore protection, *Regulation, *Zoning, Wisconsin, Lakes, Water pollution control, Water resources development.
Identifiers: *Shorelands, University of Wisconsin, County zoning, State zoning.

In August 1966 the State of Wisconsin enacted a law to minimize water pollution and to preserve fish, wildlife, and natural beauty. It prescribes county zoning of the unincorporated shorelands of all navigable waters, with the provision of state level zoning where counties fail to act by January 1, 1968. Shorelands are defined as 1000 feet from lakes and 300 feet from rivers. Small lot sizes and individual septic tanks have led to pollution of wells and surface waters, and overcrowding of the shores destroys scenic beauty. The definition of 'zoning' may include the regulation of water supply, waste disposal, tree-cutting, structure setback from highways and navigable water, filling and grading, and subdivisions; but the interpretation must not lead to the unconstitutional confiscation of private property. A group from the Wisconsin Division of Resource Development and the University of Wisconsin prepared a model shoreland protection approach which attempts to meet the statutory objectives with minimum delay by establishing a development code and a simple districting scheme for the shoreland areas. SPECIFIC PROBLEMS IN RIVERS: ALGAE IN RIVERS OF THE UNITED STATES,
Public Health Service, Cincinnati, Ohio Div of Water Supply and Pollution Control.
C. Mervin Palmer.
Transactions of the seminar on Algae and Metropolitan Wastes, held at Cincinnati, Ohio, April 27-29, 1960, sponsored by Division of Water Supply and Pollution Control and the Robert A Taft Sanitary Engineering Center. Algae and Metropolitan Wastes, U S Department of Health, Education, and Welfare, Division of Water Supply and Pollution Control; and Robert A Taft Sanitary Engineering Center, Cincinnati, Ohio, Technical Report, SEC TR W61-3, p 34-38, 1961. 3 fig, 4 ref.

Descriptors: *Rivers, *Algae, *Sampling, *Mississippi River, *Ohio River, Nuisance algae, Water quality, Sewage effluents, Diatoms, Missouri River, Columbia River, Colorado River, Tennessee River, Hudson River, Delaware River, Water pollution effects.
Identifiers: *River studies, *National Water Quality Network, Algae counts, Plankton analyses, Agricultural runoff, Arkansas River, Merrimack River, Red River, Savannah River, Snake River, Rio Grande River, Potomac River.

Investigation of algae in rivers of the United States have been lacking due to the general impression that they are relatively scarce. However, more data is needed to determine their significance as pollution indicators, stream purifiers, nuisance growths, and food for fish. Basic information should be collected for extended time periods during each month of the year for as many rivers in representative locations as possible. Such data should yield necessary background information for studies and aid in determining effects of particular factors on river biota. Since 1957, the National Water Quality Network program of the Public Health Service has carried on such sampling program for 16 rivers and the Great Lakes. For the first two years the average count per monthly samples was 3,625 algae/milliliter, lowest counts occurring in November, December, and March, highest in April, September, and October. Highest plankton counts occurred in rivers enriched by agricultural runoff and sewage effluents, particularly where toxic industrial wastes were lacking. The same few genera of algae are found to dominate rivers across the country. Two comparison studies at the Robert A Taft Sanitary Engineering Center deal with green algae of the Mississippi and Ohio Rivers and number of genera of diatoms in several river systems. ECONOMICS AND POLITICS INFLUENCE POLLUTION ABATEMENT RESEARCH,
Dow Chemical Co., Midland, Mich.
J. B. Hemwall.
Water and Sewage Works, Vol 116, No 6, p 222-225, June 1969. 4 p.

Descriptors: *Economics, *Political aspects, *Water pollution, *Pollution abatement, Value, Costs, Prices, Water treatment, Taxes, Waste disposal, Water pollution control.
Identifiers: Subsidy, Penalties, Social base, Fluid-fluid separation, Solid-fluid separation.

Meeting the research needs in pollution abatement, while necessary, is far from sufficient to get anything accomplished. The literature contains references to unmet research needs and additional information is available from the Federal Water Pollution Control Administration. This discussion, however, is addressed mainly to the influences which make pollution abatement research insufficient--namely, economics, politics and social habits. The author states that the outstanding economic characteristic of water is that it has no value. Its price is quite arbitrary and there is a great deal of federal activity that can be considered a subsidy. The economics of water is even worse after the water has been used. Initially, payment has to be made for the cost of transportation, for whatever treatment is performed, and for the

operation of the system. These items establish a cost, if not a value. Used water has neither value nor cost and there is no economic incentive to clean it up. Suggestions are offered that could improve the economics of water in this area. Other problems of water pollution abatement in the areas of politics and unmet needs are discussed. (Loeb-Rutgers)

WATERCRAFT REGULATION.

Mo Ann Stat secs 306.010 thru 306.310 (1963), as amended, (Supp 1970).

Descriptors: *Missouri, *Boats, *Boating regulations, Legislation, Boating, Water sports, Recreation, Administration, Governments, Legal aspects, Water law, Permits, Wastes, Sewage, Water pollution.
Identifiers: Water toilets.

Every motorboat operated in this state shall be numbered. Issuance and display of registration numbers is regulated. A change in ownership of a motorboat requires issuance of a new registration number. Motorboats registered under a federal number system or a federally approved state system are not required to register, nor are vessels owned by the United States or ships' lifeboats. Motorboats are divided into four classes according to length for purposes of equipment and lighting requirements prescribed by statute. Reckless or drunken operation of motorboats is prohibited. Motorboat regattas and towing of waterskiers are regulated. Operators involved in motorboat accidents are required to aid accident victims. If an accident results in death or property damage greater than $100 the operator must file a report with the Boat Commission created by statute. Boat livery is regulated. Funds collected from motorboat registration shall be used to promote safe boating. Each violation under this chapter is punishable by fine or imprisonment. Marine toilets shall not discharge inadequately treated sewage. All boats are subject to inspection by the Water Pollution Board. No person shall tamper with a boat without the owner's permission. (Dye-Florida)

GENERAL SEWER SYSTEMS FOR FOURTH CLASS CITIES.

Mo Ann Stat secs 88.717 thru 88.740 (1952).

Descriptors: *Missouri, *Sewers, *Sewage disposal, *Local governments, Domestic wastes, Municipal wastes, Sanitary engineering, Sewage districts, Wastes, Waste water disposal, Waste disposal, Cities, Taxes, Financing, Legislation, Legal aspects.

The board of aldermen of a fourth class city may establish a system of public, district, and private sewers, paid for by taxes on all taxable property within the city. District sewers shall be established in districts prescribed by ordinance on petition by a majority of resident landowners within the district or when the board deems such establishment necessary. Taxes shall be levied throughout the district in proportion to the size of each tract taxed. Taxes may be paid in installments. Private sewers are constructed at private expense and regulated by ordinance. Private sewers may be incorporated into the public or district sewer system. The owners of appropriated private sewers shall be compensated. Owners of private sewers dissatisfied with the compensation awarded by the city may petition the circuit court for another appraisal. When the board deems necessary two or more sewer districts may be united into a joint district. The city assumes no liability for construction of private sewers unless the city owns property to be served by the sewer. (Dye-Florida)

MATHEMATICAL SIMULATIONS FOR BETTER AQUIFER MANAGEMENT,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
M. W. Bittinger, H. R. Duke, and R. A. Longenbaugh.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 509-519, 1967. 11 p, 4 fig, 13 ref.

Descriptors: *Mathematical models, *Simulation analysis, *Aquifers, *Water management (Applied), Optimization, Groundwater, Computers, Economics, Optimum development plans, Systems analysis.
Identifiers: *Aquifer management.

Manipulation of groundwater storage in conjunction with surface water supplies often requires simultaneous consideration of varied aquifer hydraulic and geometric characteristics, highly variable pumping patterns in time and space, imperfectly connected bodies of surface water, and nondeterministic natural recharge. Legal, economic, and social conditions impose constraints which must be considered in aquifer operation and management. Mathematical modeling and computer analysis techniques allow consideration of these varied and changing factors. Applications to specific aquifer management problems are discussed. (Knapp-USGS)

DIGITAL COMPUTER SIMULATION OF ECOLOGICAL SYSTEMS,
Pennsylvania Univ., Philadelphia. Johnson Research Foundation.
David Garfinkel.
Nature, Vol 194, No 4831, p 856-857, 1962. 5 fig, 1 tab, 10 ref.

Descriptors: *Digital computers, *Simulation analysis, *Systems analysis, *Ecosystems, Analytical techniques, Planning, Food chains, Predation, Grazing, Computer programs, Computer models.
Identifiers: Ecological efficiency, Population dynamics, UNIVAC I, Mass action law, Theoretical ecology, Competitive exclusion principle.

Certain ecological processes are analogous to chemical reactions, describable by the mass action law of chemistry; such similarities permit derivation of methods approximating ecosystems of varying complexity. By representing ecological interactions as chemical reactions, program--devised for UNIVAC I--enables digital computer to write instructions automatically and solve an associated set of differential equations, by numerical methods when presented with a set of initial conditions. Behavior of a theoretical ecosystem is examined where grass is grazed by rabbits, which may be adequately fed or starved, with assumption that starved rabbits die, whereas fed rabbits reproduce. Grass is considered partially unavailable to guarantee its constant influx to system. System is simulated by nine equations, each with a rate constant, and three resultant differential equations. Varying predative efficiency demonstrates ecologically identifiable situations where rabbit population becomes extinct, their numbers attain steady state with time, or are thrown into periodic or damped oscillations. Methods are advantageous because: computer deals with the mathematics; degree of complexity is limited only by speed and memory of computer. Calculations are applicable to theoretical studies or actual situations, as in pest control, but calculability cannot substitute for detailed knowledge of ecosystem involved. (Eichhorn-Wisconsin)

DEVELOPMENT OF A MATHEMATICAL MODEL FOR PREDICTION OF TEMPERATURE IN DEEP RESERVOIRS-PHASE II: HIGH DISCHARGE-VOLUME RATIO RESERVOIRS,
Water Resources Engineers, Inc., Lafayette, Calif.
G. T. Orlob, L. G. Selna, and D. E. Evenson.
Progress Report prepared for the Department of Fish and Game, State of California, by the Water Resources Engineers, Inc., September, 1966. 12 p, 7 fig.

Descriptors: *Mathematical Models, *Temperature, *Reservoirs, *Thermal stratification, Lakes, Diffusion, Heat transfer, Energy transfer, Digital computers, Density currents, California.

The modification of the mathematical model for computation of temperature distribution in reservoirs to make it useful for that of reservoirs which have highly variable horizontal cross-sections or which experience time varying independent inflow and outflow is discussed. The mathematical model is designed to account for net heat flow input from the atmosphere. Using this model, it would be possible to simulate a complete annual cycle of temperature change in an operating reservoir. Certain assumptions, such as the independence of heat flow and reservoir surface temperature, would continue to restrict the versatility of the model. The objective of this report is to give a detailed account of the generalizations made in the one dimensional reservoir temperature model mentioned in the Phase-I report. The model was tested using the data obtained in the Lake Tahoe studies. (See W70-04483). (Novotny-Vanderbilt)

DEVELOPMENT OF A MATHEMATICAL MODEL FOR PREDICTION OF TEMPERATURE IN DEEP RESERVOIRS PHASE I: LOW DISCHARGE VOLUME RATIO RESERVOIRS,
Water Resources Engineers, Inc., Lafayette, Calif.
G. T. Orlob, L. G. Selna, and D. E. Evenson.
Progress Report, prepared for the Department of Fish and Game, State of California, July, 1966. 38 p, 9 fig., 1 tab.

Descriptors: *Mathematical models, *Temperature, *Reservoirs, *Thermal stratification, Hypolimnion, Epilimnion, Digital computers, Diffusion, Envirnomental effects, Heat transfer, Energy transfer, Thermocline, Density currents, California.

Development of a mathematical model capable of simulating the natural annual thermal cycle in deep reservoirs is presented. Construction of this model is governed by the physical principles of water movement and energy supply and transfer. The development of the computer program is based on physical representation of a system expressed by Fick's Laws of Diffusion. The other physical principle is a consequence of the force-deformation properties of water. The eddy diffusion coefficient in the hypolimnion is assumed to be virtually constant but attains a maximum at or near the water surface and a minimum at the thermocline. The finite element technique was chosen for the solution on a digital computer. The program was written in the FORTRAN IV computer language, and description of the program and data preparation is included in the Appendix of the report. A test case is described. (See W70-04473). ESTIMATION AND IDENTIFICATION OF COBB-DOUGLAS PRODUCTION FUNCTIONS,
Stanford Univ., Calif.
Marc Nerlove.
Rand McNally and Co, Chicago, 1965. 193 p.

Descriptors: *Estimating, Statistical methods, Economic efficiency, Return to scale, Time series analysis, Cross-sections.
Identifiers: *Econometrics, *Estimation, *Identification, *Cobb-Douglas production function, Inputs, Outputs, Marschak-Andrews Approach, Perfect competition, Regulated industries, Klein's approach, Reduced form estimation.

This monograph is concerned with what the economist can say about the physical relationship between the output of a specific commodity and the inputs of the factors used in the production of that commodity. An econometric investigation has its place as a first step toward a full understanding of the relation of the production function. The monograph is restricted mainly to consideration of a single industry composed of individual firms producing a uniform product and using just two factors of production, labor and capital. Complications caused by introducing additional factors of production are discussed in the empirical study presented in chapter 6. Most of the discussion assumes that the relation between the output of the product and the inputs of the factors is linear in logarithms. The Cobb-Douglas production function serves to illustrate problems in determining production functions and some general issues of estimation and identification in econometrics. Several studies are reviewed and attention is drawn to the need for relevant assumptions. Production functions, as well as other econometric methods, have been used extensively in the water area and this discussion presents a comprehensive treatment of the problems and implications of empirical estimation of production relations. (Loeb-Rutgers)

A THRESHOLD REGRESSION MODEL,
Ecole des Hautes Etudes Commerciales, Montreal (Quebec).
Marcel G. Dagenais.
Econometrica, Vol 37, No 2, p 193-203, April 1969, 11p, 25 ref, 4 fig.

Descriptors: *Mathematical studies, Economic evaluation, *Maximization, Time series regression, Model studies, Prices, Economic efficiency, Statistics, Regression analysis.
Identifiers: *Discontinuities, *Steplike time paths, Durable goods, Econometrics.

A special regression model is suggested to analyze economic variables possessing step-like time paths. The dependent variable is assumed not to move until the concerted action of the independent variable and the error term induces it to overcome its reaction threshold. This type of reaction can be applicable in many water resource studies where discontinuities have been observed in the production cost and demand functions. The model is presented and an application to time series data, plant size increases and cross section problems is demonstrated. The article concludes with an explanation of some of the computational problems and the derivation of the likelihood function of the model. (Murphy-Rutgers)

COMPUTATION OF ZELLNER-THEIL'S THREE STAGE LEAST SQUARES ESTIMATES,
Yale Univ , New Haven, Conn.
R. Narayanan.
Econometrica, Vol 37, No 2, p 298-306, April 1969. 9p, 5 ref.

Descriptors: *Economics, *Statistics, *Estimation, Mathematical studies, Model studies, Maximization, Least squares method, Economic evaluation
Identifiers *Econometrics, *Three stage least squares, *Identification.

The estimates of the parameters in the group of over-identified equations of a simultaneous equation system are unaffected if the three stage method is applied to this system. This adds to the conclusion reached by others that the large sample efficiency of the estimates is unaffected. This result is established for the general case of a simultaneous equation system subject to linear homogeneous a priori restrictions, whereas many other known properties of the three stage least squares method have been demonstrated only for the special case of simple restrictions on the structural coefficients. The potential use of three stage least squares estimation methods in model formulation and estimation of water resource systems makes this article useful to the water researcher. (Murphy-Rutgers)

ALTERNATIVE APPROACHES TO THE PRODUCTION PROGRAMMING PROBLEM,
Brown Univ., Providence, R.I.
M. J. Beckmann.
Engineering Economist, Vol 13, No 3, p 173-186, Spring 1968. 14pp, 5 tab, 7 ref.

Descriptors: *Linear programming, *Optimization, Economic efficiency, Computers, Marginal cost, Prices, Input-output analysis, Rivers, Canals, Agriculture, Cities, Transportation, Profits.
Identifiers: *Production programming, *Decision making, *Control variables, *Constraints, *Elimination principle, *Substitution method, *Valuation method.

A theory of production is treated in terms of relevant decision variables, rather than inputs and outputs. Linear programming and more general mathematical programming is used to analyze production in terms of control variables. Minimum cost and optimal utilization of inputs are aims of this method. In the example used, all profits are imputed to the single scarce factor. Linear programming is adapted to analysis of the compliated relationships that characterize modern decision-making problems. In the calculations, the constraints are in equation form rather than inequality form for ease of computation, although additional variables must then be introduced. The elimination principle, the substitution method, and the valuation method are all explained as various approaches to production programming. The variety of methods given and the precision offered in these methods of evaluating production phenomena make this article useful to decision-makers in the water resource field. (Murphy-Rutgers)

evelopment, Recreation, Legal liabilities, Liability nsurance.

rogress on three separate phases of the research roject are outlined: (1) Role of Economic Base tudy- A framework for evaluation of recent base tudies was developed. Several studies were eviewed to determine the role and delineate cases f superior analysis. Studies were ranked to deter- ine their ability to perform various functions as- ociated with water development. The major role lentified for the economic base study in water esource administration settings was to measure the ffects of water resources development on the conomic base of a region. (2) Evaluation of Spe- ial Study Contracts with State Water Board The tudy focused on an evaluation of special study ontracts entered into by the Colo. Water Conser- ation Board over a 10-year period, 1959-60 - 967-68. The evaluation included an overall analy- s of the Board's expenditures, a review of the in- ividual contracts, an analysis of the contract rocedure and an attempt to specify the nature of ublic benefits derived from these contracts. (3) ecreation Property Owner Liability - A discussion f owners' and possessors' rights, duties and liabili- es permits recognition of potential problem areas n management and permissive use by recrea- onists of private property.

MULTIPLE PURPOSE RIVER DEVELOPMENT,
Johns Hopkins Univ., Baltimore, Md. Dept. of Sanitary Engineering and Water Resources.
Abel Wolman.
Journal American Water Works Association, Vol 62, No 2, p 71-74, Feb 1970. 4 p.

Descriptors: *Planning, *Water resources development, *Multiple-purpose projects, *Inter-basin transfers, Interstate, Legislation, Optimum development plans, Political aspects, River basin development, Social aspects, Urbanization.
Identifiers: Water resources planning.

The history of water resources research in North America is briefly reviewed. Present trends are discussed and suggestions are made for more efficient ways of utilizing river basin resources. Historically, interest in water was largely local, dominantly single-function, and most often in isolation, even where uses were regional in character. Water development in general was haphazard. Orderless, unintegrated treatment of water problems should no longer be tolerated. The maximum supply of water that can be made regularly available in each drainage area must be put to its best coordinated use. Since 1936, legislation, executive order, and public pressure all give well-supported evidence that the spectrum of multipurpose use has been widely accepted, often practiced in execution, and often operated in fact. The drainage basin, while obviously a good hydrology unit, may be of less value as an economic or social unit. In the last 30 years, planners in the United States have moved steadily from single purpose to multiuse of river systems. For hydrologic purposes the river basin provides sound underpinning. For social purposes, larger projects are often desirable, providing smaller-scale social and hydrological aspects are not overlooked or slighted. Retrospective studies (post-audits) of existing projects should be pursued to provide realistic experience to strengthen future plans. (Knapp-USGS)

DELAWARE RIVER BASIN COMPACT.

Pa Stat Ann tit 32, secs 815.50, 815.101 (1967).

Descriptors: *Pennsylvania, *Interstate compacts, *River basin development, *Delaware River Basin Commission, Water management (Applied), Regulation, Water allocation (Policy), Interstate rivers, Delaware River, New Jersey, Project planning, Administration, Water utilization, Flood plain zoning, Water resources development, Standards, Coordination, Water supply, Water pollution control, Flood control, Watershed management, Hydroelectric power, State governments, Financing, Legal aspects.
Identifiers: *Delaware River Basin Compact.

In order to improve the Delaware River between Philadelphia, Pennsylvania and Trenton, New Jersey, the Department of Forests and Waters is authorized to cooperate with the United States as much as possible and do all acts necessary to effectuate the purpose of improving the river area. The purposes of the Delaware River Basin Compact are to promote interstate comity; to remove causes of controversy; to secure and protect present developments within the states; to encourage and provide for the planning, conservation, and development of the basin's water resources; to provide for cooperation by the signatory parties; and to apply the principle of equal treatment to all water users and to all users of related facilities without regard to established political boundaries. This Compact has an initial duration of 100 years. Commissioners appointed by the President of the United States, and the governors of the signatory states of Delaware, New Jersey, New York, and Pennsylvania, make up the Delaware River Basin Commission. The general areas dealt with by the Compact are: water supply; pollution control; flood protection; watershed management; recreation; hydroelectric power; and regulation of withdrawals and diversions. Descriptors: *Scenery, *Rivers, *Aesthetics, *Natural resources, *Evaluation, Cost-benefit analysis, Parks, Recreation, Conservation, Scenic easements, Wild rivers, Geomorphology.
Identifiers: Quantitative scenery-evaluation.

A preliminary attempt was made to quantify some elements of aesthetic appeal while eliminating, insofar as possible, value judgments or personal preferences. If methods of recording such factors can be developed, the results promise to be a useful, new kind of basic data needed in many planning and decision-making circumstances. Such data would be especially useful when choices must be made among alternative courses of action. Such data would tend to provide a more prominent consideration of the nonmonetary aspects of a landscape. (Knapp-USGS)

POTOMAC-SHENANDOAH RIVER BASIN.
Virginia Dept. of Conservation and Economic Development, Richmond. Div. of Water Resources.

Virginia Division of Water Resources Planning Bulletins No 207-210 (4 vol), 1968. 772 p, 300 plates, 92 tab, 111 ref, 2 append.

Descriptors: *Water resources development, *Planning, *Virginia, Hydrogeology, Rivers, Economics, Water requirements, Water supply, Water quality, Streamflow, Water yield, Water management (Applied).
Identifiers: Shenandoah River, Potomac River.

The purpose of this study by the Virginia Division of Water Resources for the Board of Conservation and Economic Development is to re-examine the Potomac-Shenandoah Basin in light of its latest growth, to project the economy of the area to the year 2020, and to determine the quantitative and qualitative water needs of the area for the future as well as for the present. A firm program for development and use of the waters of the basin is also presented. The reports of the study will be contained in six volumes. Volume I is an introductory volume, Volume II is an economic base study of the basin. Volume III contains a hydrologic analysis of the basin to include a study of surface water, groundwater, and meteorology. Volume IV presents the quantitative and qualitative water resource requirements in the basin. (Knapp-USGS)

DELAWARE RIVER BASIN COMPACT (POWERS AND DUTIES OF THE COMMISSION).

Pa Stat Ann tit 32, sec 815.101, Art 1 thru 3 (1967).

Descriptors: *Pennsylvania, *Interstate compacts, *Delaware River Basin Commission, *River basin development, Project planning, Coordination, Administrative agencies, Legal aspects, Conservation, Water law, Federal government, Federal-state water rights conflicts, Water resources development, Equitable apportionment, Water allocation (Policy), Diversion, Prior appropriation, Adminis-

tration, Standards, Research facilities, River forecasting, Use rates, Delaware River.
Identifiers: *Delaware River Basin Compact, *Comprehensive plan.

The Commission is the develop plans and projects relating to the water resources of the Basin. The Commission has the power, in accordance with the doctrine of equitable apportionment, to allocate the Basin's waters to and among the signatory states, and to impose conditions and release requirements related thereto. The Commission is also empowered to plan, construct and operate any projects or facilities to accomplish the purposes of this Compact. It may establish standards for all projects and facilities that affect the Basin's water resources, including water and waste treatment plants, recreational facilities, trunk mains for water distribution, local flood protection works, small watershed management programs, and groundwater recharging operations. In addition, the Commission may: conduct and sponsor research on water resources; compile and coordinate systematic stream stage and groundwater level forecasting data; conduct special groundwater investigations; prepare and publish information with respect to the water problems of the Basin; negotiate for finances; and fix or alter rates for the use of facilities which it owns or operates. (Dearing-Florida)

ECOLOGY: ITS PLACE IN WATER MANAGEMENT.
Michigan Univ., Ann Arbor. School of Natural Resources.

Water Spectrum, Vol 1, No 1, p 10-14, Summer, 1969. 5 p.

Descriptors: *Ecology, *Environment, Natural resources, *Water management (Applied), Air pollution, *Water resources development, Public opinion, Water pollution.
Identifiers: *Water resources management.

The last few years have seen a new emphasis on ecology in the management of natural resources. While ecology does not provide a master key for resource planning and management, failure to give attention to the interrelations among living organisms and their environment in the development and use of resources has had some unfortunate consequences. Evidence is accumulating that ecological information is as important an input in almost everything we do in the resources field as are economics and engineering. Increasingly, we are finding intolerable the deterioration of air and water, the marring of landscape, and the limited use of resources that preclude other highly valued uses. People are asking what sequence of changes will our developmental actions cause, and what indirect effects will these have on our environment. Few of the conditions that we now find undesirable, even intolerable, are actually new. What has happened is that pollution, loss of natural scenery, and preemption of the use of particular resources have occurred until a threshold of public awareness has been reached. More people are now perceiving clearly the trends of environmental change, earlier unnoticed, and are bringing pressure on public agencies and private firms to mend their ways.

METROPOLITAN AREA DEFINITION: A REEVALUATION OF CONCEPT AND STATISTICAL PRACTICE,
Chicago Univ., Ill. Dept. of Geography.
Brian J. L. Berry.

Available from US Bureau of the Census, Wash, DC, 20233, price - $0.50. US Bureau of the Census, Working Paper 28, 1969. 45 p, 20 fig, 91 ref.

Descriptors: *Planning, Cities, Urbanization.
Identifiers: *Metropolitan water resources, *Standard Metropolitan Statistical Areas, *Functional Economic Areas, *Consolidated Urban Regions.

A fundamental problem in metropolitan water resources is the establishment of the planning area. To this end, this study of metropolitan area definition is particularly useful to the water resource planner and manager. The purpose of this study is to conduct an examination of existing principles of area classification for Standard Metropolitan Statistical Areas, and an examination of alternate criteria in order to formulate new principles of area classification. The following steps to revise metropolitan area definitional practice in 1970 were recommended: (1) county building blocks or equivalent units be retained as the basis of any area classification, in all parts of the country; (2) county-to-county commuting data be the basis of the classification of counties into functional economic areas; (3) Functional Economic Areas (FEA) be delineated around all central counties satisfying Standard Metropolitan Statistical Area (SMSA) population criteria and in addition be created for smaller regional centers of population 25,000 to 50,000 in less densely populated parts of the country; (4) where significant cross-commuting takes place, FEA's be merged by the creation of a consistent set of Consolidated Urban Regions (CUR); and (5) consideration be given, for neatness of social accounting, to allocating all unallocated counties to one of the FEA's or CUR's on the basis of additional criteria or regional interdependence. THE ECONOMICS OF NATURAL DISASTERS: IMPLICATIONS FOR FEDERAL POLICY,
Douglas C. Dacy, and Howard Kunreuther.
The Free Press, New York, NY, 1969. 270 p, 59 tab, 15 fig, 3 append.

Descriptors: *Disasters, Earthquakes, Flooding, Tornadoes, Resource allocation, Federal policy, *Flood plain insurance, Flood damage, Institutional constraints.
Identifiers: *Disaster relief, *P.L. 875, Small Business Administration, Cost of damages, Convergence behavior.

This book consists of essentially a series of arguments for the development of a comprehensive disaster insurance system as an alternative to the present paternalistic Federal policy. The reason given for the increasing role of government in disaster relief is the absence of adequate insurance coverage to homeowners and businesses in hazard-prone areas. The economics of disaster are divided into three parts: (1) statistical evidence on the increasing cost of natural disasters; (2) empirical evidence on short-term recuperation behavior; and (3) capital and labor needs facing disaster areas. Examined also is the Federal government role in providing disaster relief to the private sector ranging from the offering of low-interest loans from the Small Business Administration (SBA) for the replacement or repairing of damaged homes and businesses to the National Flood Insurance Act of 1968. The authors contend that the passage of the Flood Insurance Act is a step in the right direction but are critical of the fact that it only applies to flood disasters. (See also W70-04173 thru W70-04181). (Starr-Chicago)

THE COST OF NATURAL DISASTER IN THE UNITED STATES,
Douglas C. Dacy, and Howard Kunreuther.
In: The Economics of Natural Disasters: Implications for Federal Policy, Chapter 1, p 3-30, The Free Press, New York, NY, 1969. 10 tab, 3 fig.

Descriptors: *Disasters, Earthquakes, Flooding, Tornadoes, Resource allocation, Federal policy, *Flood plain insurance, *Flood damage
Identifiers: *Disaster relief, *P.L. 875, Small Business Administration, Cost of damages, Convergence behavior.

The threat from violent acts of nature has changed within the past century from an expectation of significant loss of life to an expectation of significant loss of property. This reversal of the life-property loss relationship is a consequence of advancing civilization: (1) the fact that man has built up his physical environment at a rapid rate; and (2) advances in meteorology and communications have made it possible to give ample warning to population of imminent disasters. A figure conceded to be an understatement (since it is only an estimate and one made in 1956) is that the average damage to the United States from hurricanes, floods, tornadoes and earthquakes has exceeded $600 million annually. This figure does not include other cyclonic, non-cyclonic storms, tidal waves, fires, droughts, freezes and rainstorms. The detailed statistical work in this book covers the period from 1925-1964. Yet 1965, which is not included, was the worst year in U.S. history, from the point of natural disasters and its cost to the nation. For the purpose of determining costs of disasters by region, the United States is divided into six fairly large regions: (1) Northeast; (2) Southeast; (3) Western; (4) South Central; (5) North Central; and (6) Ohio Valley. A section on immediate postdisaster estimates indicates that actual losses usually run about one-third of the figures given in the first estimates immediately following a disaster. The effects of such overstatements are: (1) makes it appear that recovery was much faster than it actually was; and (2) makes it easier politically for the Federal government to disperse aid more generously. (See W70-04172). (Starr-Chicago)
W70-04173

RELIEF IN NATURAL DISASTERS,
Douglas C. Dacy, and Howard Kunreuther.
In: The Economics of Natural Disasters: Implications for Federal Policy. Chapter 2, p 31-57, The Free Press, New York, NY, 1969. 5 tab, 3 fig.

Descriptors: *Disasters, Earthquakes, Flooding, Tornadoes, Resource allocation, Federal policy, Flood damage, *Institutions.
Identifiers: *Disaster relief, *P.L. 875, Small Business Administration, Cost of damages, Convergence behavior.

The purpose of this chapter is to demonstrate quantitatively the extent of the socialization of disaster costs and qualitatively how the process of Federal aid is becoming institutionalized. While the cost of natural disasters has risen rapidly the amount of financial aid to disaster victims has grown even faster and reflects a new social attitude. A section of this chapter is devoted to organizations providing assistance. Until the early fifties the major disaster relief agency in the United States was the American National Red Cross. Within the past fifteen years the Federal government has assumed a leading role; some fifty Federal agencies, bureaus and offices are involved in domestic relief. Aid to both the public and private sector is provided by the Federal government. U.S. top laws also provide another source of relief to private citizens. An analysis of statistical evidence indicates that Federal participation has increased markedly during the sixties; and a review of recent legislation indicates that Federal participation is not likely to be reduced in the future. This change in the Federal government's role is attributed to and seen to be consistent with its growing concern and involvement with problems of welfare. (See W70-04172). (Starr-Chicago)

ss Administration, Cost of damages, Conver-
nce behavior.

his chapter is concerned with a theoretical analy-
s of behavior following natural disasters. It is di-
ded into two sections: (1) the economic choices
cing the community immediately following a dis-
ter; and (2) the long-term recovery phase that
turns a community to its predisaster level. The
roblems of information and communication im-
ediately after a disaster are analyzed. Since
sually only incomplete information exists, the
ecision maker is forced to make a decision
ithout really having a choice of alternatives. The
ime concern of decision makers in disaster-torn
reas is to obtain as many emergency supplies as
ossible. They cannot calculate the economics of
ortage/storage cost ratios; they must concern
emselves with supply and demand problems.
sing concepts from the decision-making process
a firm, the authors illustrate how a better priority
heme for emergency shipments could be
eveloped with improved information on damage
nd requirements. In terms of short-term recovery,
ost disaster needs can then be met more easily and
a lower cost. In terms of the most efficient long-
rm recovery, labor and outside aid in the rebuild-
g sector should be devoted to those capital goods
hose marginal productivity is highest. (See W70-
4172). (Starr-Chicago)

ess Administration, Cost of damages, Conver-
ence behavior.

Differentiated in this chapter on organizational
ehavior in a disaster are those events which have a
arning period (e.g., hurricanes, floods), from
hose with minimal notice (e.g., tornadoes) or from
hose with none at all (e.g., earthquakes). Efficient
ction after a catastrophe is often hampered by
hat the author calls 'convergence behavior'--the
ass movement of messages, supplies and people
oward the stricken area. The effects of the uncer-
inty caused by organizational problems and con-
ergence problems in specific disasters are
nalyzed and recommendations are made for al-
eviating the problems. The analyses of specific dis-
sters and actions taken in these disasters cover:
1) Hurricane Carla, 1961; (2) Waco and San An-
clo Tornadoes, 1953; and (3) Alaska Earthquake,
964. In order to reduce the problems caused by
onvergence behavior certain suggestions are
iven: (1) the establishment of a central office
here people may register their names and
hereabouts, thereby eliminating many telephone
alls; (2) a telephone line linking the office with
ospitals to permit rapid communication of fatali-
ies and injuries; (3) establishment of a priority
ystem for incoming phone calls so that lines are
ept open for emergency groups; (4) creation of a
entral supply clearing house to handle the deluge
f clothing, food and unsolicited supplies coming
nto the disaster area; and (5) delaying public an-
ouncement of a disaster to the rest of the nation
or several hours so as to avoid convergence
roblems caused by curious outsiders. (See W70-
4172). (Starr-Chicago)

SHORT-RUN SUPPLY AND DEMAND PROBLEMS,
Douglas C. Dacy, and Howard Kunreuther.
In: The Economics of Natural Disasters: Implications for Federal Policy, Chapter 5, p 102-120, The Free Press, New York, NY, 1969. 5 tab.

Descriptors: *Disasters, Earthquakes, Flooding, Tornadoes, Resource allocation, Federal policy, *Flood damage.
Identifiers: *Disaster relief, *P.L. 875, Small Business Administration, Cost of damages, Convergence behavior.

This chapter deals with the short-run problems of resource allocation following a serious disaster, i.e., food and housing, with specific reference to the Anchorage, Alaska disaster and other disaster experiences. The authors contend that most problems of supply and demand are short-term in nature because of the large amount of aid coming from outside the disaster area. Also, post disaster behavior by individuals, who operate in an altruistic fashion, serves to limit the shortages and thereby tends to keep prices lower than they would be in a regular short supply and large demand market. The authors point out the advantages of stockpiling items to handle emergency problems. While housing is not an item that can be stockpiled, actual experiences indicate that most disaster victims are usually placed in homes of friends, relatives or magnanimous community individuals by the first evening after the disaster. The consequence of this fact is that rents usually do not rise after a disaster strikes an area. (See W70-04172). (Starr-Chicago)
W70-04177

PLANNING FOR RECOVERY: THE SPECIAL PROBLEM OF DAMAGE ASSESSMENT,
Douglas C. Dacy, and Howard Kunreuther.
In: The Economics of Natural Disasters: Implications for Federal Policy, Chapter 6, p 123-140, The Free Press, New York, NY, 1969. 9 tab.

Descriptors: *Disasters, Earthquakes, Flooding, Tornadoes, Resource allocation, Federal policy, *Flood damage.
Identifiers: *Disaster relief, *P.L. 875, Small Business Administration, Cost of damages, Convergence behavior.

Assessing the value of physical damage to a disaster area constitutes one of the most difficult problems for a community. Dollar value must be quoted in order to qualify as a Federal disaster area and be eligible for aid under P.L. 875. Little information is available on what cost criteria are the bases for such damage estimates. Also, the unit of analysis is a critical factor in interpreting damage reports and in understanding the meaning of the word 'disaster.' The authors distinguish between three categories of losses: (1) losses to the public sector, e.g., sewer, electricity, telephone, Federal, state and local structures and roads; (2) losses to the private sector; e.g., physical damage to homes and businesses, and indirect economic losses as a result of the curtailment of businesses or a lower level of business operations; and (3) shortfall of revenue, or the decline of state and Federal government receipts from various tax and levies. An analysis of damage estimates and expenditures following the Alaska earthquake indicates that there is a tendency to overestimate damages during the period immediately following a disaster. This pattern is consistent with what has also occurred in other disaster areas; initial figures are almost twice as high as final damage estimates. (See W70-04172). (Starr-Chicago)
W70-04178

RECONSTRUCTION AND ECONOMIC DEVELOPMENTS FOLLOWING A DISASTER,
Douglas C. Dacy, and Howard Kunreuther.
In: The Economics of Natural Disasters: Implications for Federal Policy, Chapter 8, p 152-182, The Free Press, New York, NY, 1969. 9 tab, 2 fig.

Descriptors: *Disasters, Earthquakes, Flooding, Tornadoes, Resource allocation, Federal policy, *Flood damage, Intangible benefits.
Identifiers: *Disaster relief, *P.L. 875, Small Business Administration, Cost of damages, Convergence behavior.

It is difficult to measure exactly the progress made in the recovery period after a disaster strikes a community, and this is particularly true in the private sector. Data are not available which sort out rebuilding as a result of a disaster from overall construction activity. Activity in the public sphere is more predictable since special reports are likely to exist on work performed by Federal agencies. This chapter describes the recovery progress in Skopje, Yugoslavia following the earthquake in 1963 and compares the restoration rate for public facilities there with the rate in Anchorage, Alaska. Described also are post disaster economic improvements due to technological innovations as well as social and political factors. The empirical evidence indicates that a community may benefit economically from a disaster as a result of the rapid inflow of capital for rebuilding purposes and the adoption of technological innovations to meet crisis situations. Cited also are examples of indirect benefits to regions as a result of the physical effects of the disaster: (1) a tornado in Topeka in 1966 carried out a patch almost identical to one proposed by the city for a new superhighway; and, (2) fishing after hurricane Carla was better as a result of the cleansing of the coral reefs by the surging waters. (See W70-04172). (Starr-Chicago)
W70-04179

THE COST OF FEDERAL RELIEF,
Douglas C. Dacy, and Howard Kunreuther.
In: The Economics of Natural Disasters: Implications for Federal Policy, Chapter 11, p 222-228, The Free Press, New York, NY, 1969. 3 tab.

Descriptors: *Disasters, Earthquakes, Flooding, Tornadoes, Resource allocation, Federal policy, Taxes, Compensation.
Identifiers: *Disaster relief, *P.L. 875, Small Business Administration, Cost of damages, Convergence behavior.

The cost to Federal agencies of providing technical assistance, equipment, materials and essential services to a stricken area is relatively low. The most costly type of assistance is a grant given under P.L. 875 to restore public facilities. The type of aid constitutes a transfer payment--from one group of people to another and must eventually be paid for in full out of taxes. Another kind of transfer payment is the loss in Federal revenue due to the tax write-off provisions. A third kind of transfer is that which results from low interest rate loans from the Small Business Administration. The authors assume that: (1) sixty to eighty per cent of total disaster losses pertain to private property; (2) sixty to eighty per cent of private property is not insured; and (3) the tax rate applicable on casualty write-off is between 15 and 25 per cent. On the basis of these assumptions, the authors contend that loss in Federal revenue would vary between 5.4 and 16 per cent of the total estimated disaster losses, or an average estimate of 10 to 11 per cent. The forecast of future annual Federal cost for the next decade in present disaster programs is estimated to be an average of $92 million. (See W70-04172). (Starr-Chicago)
W70-04180

THE NEED FOR COMPREHENSIVE DISASTER INSURANCE,
Douglas C. Dacy, and Howard Kunreuther.
In: The Economics of Natural Disasters: Implications for Federal Policy, Chapter 12, p 229-261, The Free Press, New York, NY, 1969. 3 tab.

Descriptors: *Disasters, Earthquakes, Flooding, Tornadoes, Resource allocation, Federal policy, Flood plain insurance, Compensation.
Identifiers: *Disaster relief, *P.L. 875, Small Business Administration, Cost of damages, Convergence behavior.

Specific criticisms are made against the equity of the current Federal system of disaster relief: (1) low-interest SBA loans or outright grants are only given to areas classified by the Federal government as a disaster area or to areas covered by special congressional legislation; (2) the Federal policy tends to reward the imprudent rather than the prudent individual; and, (3) Federal relief does nothing to discourage individuals from moving into disaster-prone regions, e.g., flood plains. An analysis of current disaster insurance policies is given which indicates the insurance industry's lack of coverage against various natural disasters. The conclusions reached about the rationale behind the insurance industry's position are: (1) companies encourage individuals to take out insurance policies if there is a small risk of large-scale damage; (2) insurance companies willingly provide coverage against a natural disaster, such as a tornado, that could potentially affect any part of the country. The relatively low premiums of many are used to pay for the high damage of a few; (3) insurance companies are concerned with their public image and, therefore, are willing to provide earthquake insurance, if requested to do so; and (4) until this year companies have opposed flood insurance because of the relative certainty of the event in particular regions and the assumption that only individuals in those hazard-prone areas would be interested, thereby causing unusually high rates for the insurance. (See W70-04172) (Starr-Chicago)

DELAWARE RIVER BASIN COMPACT (WATER SUPPLY, POLLUTION CONTROL, FLOOD PROTECTION).

Pa Stat Ann tit 32, sec 815.101, Art 4 thru 6, (1967).

Descriptors: *Pennsylvania, *Interstate compacts, *Water pollution control, *Flood protection, River basin development, Water management (Applied), Delaware River Basin Commission, Dams, Interstate rivers, Water supply, Surface waters, Groundwater, Regulation, Reservoirs, Storage, Regulated flow, Assessments, Sanitary engineering, Coordination, Treatment facilities, Classification, Warning systems, Delaware River, Waste treatment.
Identifiers: *Delaware River Basin Compact.

The Commission is empowered to develop and implement plans and projects for the use of the Basin's water for domestic, municipal, agricultural and industrial water supply. For this purpose, the Commission may construct, acquire and operate dams, reservoirs and other facilities for utilization of water resources and regulation of the use thereof. The Commission may survey and investigate, and acquire, construct, and operate projects and facilities to control potential pollution and abate existing pollution of the Basin's water resources. The Commission may classify the waters of the Basin and establish standards for treatment of wastes. The signatory states, in order to prevent pollution, agree to enact legislation to enable the maintenance of the Basin's waters in a satisfactory condition. The Commission may also plan, construct and operate projects and facilities for flood damage reduction. The Commission is to create standards relating to the nature and extent of the uses of land in areas subject to flooding. The Commission is empowered to acquire interests in land within the area of a flood plain for the purpose of restricting its use so as to minimize the flood hazard. (Dearing-Florida)

DELAWARE RIVER BASIN COMPACT (WATERSHEDS, RECREATION, HYDROELECTRIC POWER, FINANCING, GENERAL PROVISIONS).

Pa Stat Ann tit 32, sec 815.101, Art 7 thru 14 (1967).

Descriptors: *Pennsylvania, *Watershed management, *Hydroelectric power, *Financing, Interstate compacts, Withdrawal, Interstate rivers, Delaware River Basin Commission, Projects, Erosion control, Runoff, Soil management, Forest management, Recreation, Wildlife management, Recreation facilities, Dams, Diversion, Administration, Transmission (Electrical), Water shortage, Permits, Regulation, Capital, Delaware River.
Identifiers: Intergovernmental relations, Comprehensive plan, Delaware River Basin Compact.

The Delaware River Basin Commission is to promote sound practices of watershed management in the Basin, including projects and facilities to retard runoff and water flow and prevent soil erosion. The Commission is to provide for the development of water related public sports and recreational facilities. The waters of the Delaware River and its tributaries may be impounded and used by or under authority of the Commission for the generation of hydroelectric power. The Commission may regulate and control withdrawals and diversions from surface and groundwaters of the Basin. Various rules are established for the purpose of avoiding conflicts of jurisdiction. The procedures and limits for capital financing are provided. The Commission is to adopt, and may review and revise, a comprehensive plan for the immediate and long-range development and use of the water resources of the Basin. The Commission shall annually adopt a water resources program based upon the comprehensive plan. The Commission has the power of condemnation to accomplish the purposes of the Compact. RATIONAL UTILIZATION OF MEXICO'S WATER RESOURCES (IN SPANISH),
Secretaria de Recursos Hidraulicos (Mexico).
Oscar Benassini.
Comite Nacional Mexicano para el Decenio Hidrologico Internacional, Memoria 1966-1967, 1968. p 1-27, 5 fig, 7 tab.

Descriptors: *Water resources development, *Mexico, *Planning, *Water conservation, Water demand, Population, Political aspects, Social aspects, Agriculture, Industrial water, Optimum development plans, Legal aspects, Arid lands, Water pollution, Irrigation water, Municipal water, Multiple-purpose projects, Beneficial use, Surface-groundwater relationships.

The growing world-wide problems of water scarcity are discussed and applied to Mexico. While there would seem to be a sufficient supply of water, irregular seasonal and geographical distribution of rainfall refute this supposition. Baja California, the northern tier of provinces and the north-central bolson are arid regions lacking sufficient water supply. Even in areas blessed with abundance of water, concentration of population and industry are now creating scarcity and pollution. Planning is now being done to make the best possible use of all available water for each region, with emphasis upon enterprises which will least contaminate or withdraw water supplies. The Plan Hidraulico de Mexico encompasses a fundamental objective-nationwide distribution of water resources by means of dam construction and water transfer. Public dissemination of conservation information and legal restraints are also envisioned. (Moore-Arizona)

FLOOD PLAIN MANAGEMENT STRATEGY: AN ANALYSIS,
Chicago Univ., Ill. Center for Urban Studies.
John R. Sheafer.
Proceedings of the Fourth American Water Resources Conference, November 18-22, 1968. p. 255-262, 1 tab.

Descriptors: *Methodology, *Planning, *Management, *Flood plains.
Identifiers: *Flood plain management, Flood plain information, Product orientation, Process orientation, U.S. Army Corps of Engineers.

Flood plain management has become a generally accepted strategy for reducing flood losses and achieving a proper use of the flood plain. It is a complex strategy which is frequently oversimplified and unduly limited when discussed. Flood plain management is a multiple means, single purpose effort that is an integral part of the comprehensive planning process. Success in a flood plain management effort is related to the degree of active participation by local interest groups--financial, professional, occupants and services. These interest groups allocate the flood plain resource in response to a variety of forces--some of which encourage more intensive use of the flood plain and some which tend to inhibit use. Current governmental efforts to achieve a proper use of flood plains have been characterized by low interaction with management interests and a product (flood plain information) orientation. It is suggested that flood plain management efforts would be enhanced, if federal efforts achieved a higher degree of interaction with local interests and there was a shift from product to process orientation. AMENITY RESOURCES FOR URBAN LIVING,
Arthur A. Atkisson, and Ira M. Robinson.
In: The Quality of the Urban Environment, ed. Harvey S. Perloff (Baltimore: Johns Hopkins Press, 1969). p. 179-201, 3 tab, 29 ref.

Descriptors: *Social values, *Environment, *Methodology, Planning, Management, Social aspects, Urban sociology, Social needs, Attitudes, Aesthetics.
Identifiers: *Amenity resources, *Public policy, Amenity response system.

The clarification of the concept of amenities and a better understanding of what might be called the amenity management process can contribute to public policy in the environmental area. It is suggested that responses to amenities make up one of the outputs derived from man's environmental system; that these outputs can be 'managed'; and that decisional criteria and management systems can be developed to accomplish this task in a rational and socially responsible manner. Amenities are finally taken to be those stimuli which lead to feelings of comfort, pleasure or joy. Utilizing this definition a simple amenity response system is described. Five major components of this system are identified: (1) the amenity stimulus generator or precipitant; (2) the respondent; (3) the amenity; (4) the amenity response; and (5) the potential disamenities. The operation of this system is investigated in discussions of amenity responses and respondents, economic and political responses to amenities; and amenities, disamenities, and their precipitants. The demand for amenities and the amenity decision system are also investigated. With regard to the use of this type of analysis for environmental planners and managers, it is concluded that given equivalence in the economic potential of resource areas competing for development, such development should occur last in that area which exhibits the greatest amenity potential and in which the projected pattern of development would most adversely affect the area's amenity potential. (See also Vol. 2, No. 24, Field 6B, W69-10206). (Davis - Chicago)

REVIEW AND INTERPRETATION OF EXPERIENCES IN WATER RESOURCES PLANNING,
Pennsylvania State Univ., University Park. Inst. of Public Administration.
Irving K. Fox.
In: Intergovernmental Relations in Water Resources Planning, Seminar Preparation, June 2-

, 1969, Presented by the Institute of Public Administration, Pennsylvania State University, Conducted for the Corps of Engineers, p. 05-32, 1969).

Descriptors: *Planning, *Water resources development, River basin development, Decision making, Administrative decisions, Administration.
Identifiers: *Public policy, *Water resources planning, River basin planning, Public involvement, Administrative efficiency, Value optimization.

Water resources planning is reviewed over two periods, pre-World War II and post World War II. From an examination of pre-World War II water resources a number of general observations can be drawn. First, one is struck by the dynamic nature of the task that river basin planners are expected to perform. Second, certain features of the water planning situation appear to have become well established: (1) water development will continue to include a large measure of public involvement; (2) decisions regarding water development and use will not be entirely governmental decisions; (3) providing substantial subsidies to the beneficiaries of water resources development appears to be a well-established policy; and (4) the legislative branch appears limited in its ability to represent all interests concerned with highly subsidized water development programs. Third, most of the plans for water resources development in this country have been associated with broad public policy considerations. Since World War II, water resources planning has struggled with several problems. First, there is a lack of consensus as to the objectives of river basin planning. Second, a number of federal agencies have come to have independent, major interests and responsibilities in the water resource field. Third, state and local levels of government were taking a growing interest in water development decisions. The post war approaches to water resources planning are then appraised in light of two criteria, administrative efficiency and value optimization. (Davis - Chicago)

THE CHALLENGE OF GROWTH: A STUDY OF MAJOR COUNTY AND REGIONAL PARK NEEDS.
Saint Louis County Planning Commission, Mo.

St. Louis County Planning Commission, St. Louis, Mo., July 1965. 43 p, 4 tab, 5 map, 46 photo.

Descriptors: *Recreation demand, Land use, Scenic highways, Camping, Swimming.
Identifiers: *Regional parks, *Open space, *St. Louis County (Mo).

Because of the past rapid growth and urbanization of St. Louis County, decisions must be made in advance of further urban development regarding allocation of land for public parks and outdoor recreation facilities. It is estimated that the population of St. Louis County will attain a total of one million persons by 1970 and an estimated 1,175,000 persons by 1980. On the basis of these figures and on the basis of studies conducted for the county, a proposal has been made for a system of approximately 6,000 acres of major county parks and a total of at least 45,000 acres of regional parks. All of the creeks and streams are the primary drainage channels for St. Louis County and a recommendation is made to protect them from encroachment by any type of intensive development. The suggested implementation of this plan includes Federal, state and county coordination. (Starr-Chicago)

THE OPPORTUNITY COST OF DISPLACED PRIVATE SPENDING AND THE SOCIAL DISCOUNT RATE,
Grinnell Coll., Iowa.
Robert M. Haveman.
Water Resources Research, Vol 5, No 5, p 947-957, October 1969. 11 p, 6 tab, 19 ref.

Descriptors: *Investment, *Cost-benefit analysis, *Capital investment, Risks, Government, Economics, Costs, Gross National Product, Prices, Taxes, Finance, Interest rate.
Identifiers: *Opportunity costs, *Social discount rate, *Social time preference, *Empirical estimation, Shadow prices, Rate of return, Public expenditures.

This paper first presents the major contending arguments in the debate on the social discount rate concept and its empiric estimation procedure. The different concepts on this important issue are the social time preference position, the preferred opportunity cost position and the real cost of borrowed funds. The author presents his arguments for favoring the preference opportunity cost position and the ways in which this position differs from the others is described. An estimate is then made of the opportunity cost of displaced private spending using the empiric framework implicit in the preferred social discount rate concept. The implications of the social discount rate for public investment in the water resource area make this article of interest to the water resource planner. (Murphy-Rutgers)

FORECASTING PRODUCT CONSUMPTION WITH COMPUTERS,
Long Island Univ., Brooklyn, N.Y.; and Long Island Univ., Greenvale, N.Y. C. W. Post Coll.
Richard J. Ward.
Engineering Economist, Vol 10, No 3, p 1-22, Spring 1965. 22 p, 5 tab, 1 fig.

Descriptors: *Forecasting, *Computers, *Oil, Statistics, Statistical methods, Regression analysis, Least squares method, Energy, Economics.
Identifiers: *Product consumption, Standard error, Trend.

The analysis presents a possible approach to forecasting petroleum--and, by implication, other product consumption with the assistance of computers. As distinct from an end-use method, where elaborate efforts are made to estimate consumption on the basis of a forecast of the units which consume the product, the method developed here relies more upon statistical measures. The technique requires only rudimentary knowledge of statistical and economic relations and it is argued here that the essence of good forecasting is to keep the forecaster's philosophy, moods, normative judgments or vested interests at the barest minimum, and to allow the facts and statistical analysis to carry as much of the forecasting burden as possible. Forecasting techniques have been used extensively in the water area and this article is of general interest to water use studies. (Loeb-Rutgers)

THE RATE OF RETURN AND ASSESSMENT OF RISK,
California Univ., Los Angeles.
J. Morley English.
The Engineering Economist, Vol 11, No 3, p 1-12, Spring 1966. 13 p, 5 ref.

Descriptors: *Risks, *Interest rate, Investment, Costs, Economics, Mathematical studies, Profits, Capital, Management, Inflation, Growth rate.
Identifiers: *Rate of return, *Discount rate, Time scale, Utility functions, Dividends.

In conventional evaluation of investment alternatives some index of desirability must be established. Whatever this index, the basic concept requires discounting future dollars at some acceptable rate of return. Risk is often considered by an arbitrary selection of a high rate of return. The author derives a general expression for an interest rate or internal rate of return for use in evaluation of a single investment, in context with the business as a whole. This provides a rational basis for selecting a suitable rate of return for each investment project to be considered. The use of the suggested approach gives different rates of return for projects involving different risks. It shows how size of investment will affect the required rate of return and explains the time relationship to be considered. The importance of the rate of return in considering alternative water resource investments makes the article valuable to the water resource planner. (Murphy-Rutgers)

OPTIMAL GROWTH AND INVESTMENT ALLOCATION,
Harvard Univ., Cambridge, Mass.; and Brandeis Univ., Waltham, Mass.
Sanjit Bose.
The Review of Economic Studies, Vol 35, No 104, p 465-480, October 1968. 16 p, 3 fig, 8 ref, 2 append.

Descriptors: *Investment, Capital.
Identifiers: *Optimal growth, *Investment allocation, Capital accumulation, Infinite horizon case, Finite horizon case.

The optimal programme of capital accumulation is examined in a two sector (consumption and investment) model of growth where the margin of decision is the allocation of investment between the two sectors. This is done by assuming that capital, once installed in a sector, cannot be used in the other, or that investment is irreversible, and by abstracting from labor as a primary output. The resulting production model is well known. The main significance of the model lies in bringing out the limitations imposed upon the choice of current output composition by the inherited structure of capital. The Ramsey approach of optimal savings is adopted in this paper. The optimal growth properties for the infinite and finite horizon cases are examined and some mathematical proofs are given in the appendices. This model has potential application problems in the public good area in general and the water area in particular where investment is irreversible. (Loeb-Rutgers)

WATER RESOURCES DEVELOPMENT, PLANNING, ENGINEERING AND ECONOMICS,
Manitoba Univ., Winnipeg.
Edward Kuiper.
Washington, DC, Buterworth Inc, 1965. 483 p.

Descriptors: *Water resources development, *Planning, *Engineering, Economics, Hydraulics, Hydraulic structures, Flood control, Irrigation, Navigation, Water supply, Benefits, Costs, Dams, Spillways, Interest, River systems.
Identifiers: River system development, Water power, Present value, Annuities.

This book deals with the problem of developing a river system for the greatest benefit of the people that live in its drainage basin. Chapter 1 discusses the different aspects that have to be taken into consideration when planning the water resources development of a drainage basin. Chapters 2 to 5

deal with basic engineering subjects such as hydrology, hydraulics, river morphology, and hydraulic structures. Chapters 6 to 10 deal with the main components of river development: flood control, water power, irrigation, navigation, and water supply. The discussions in these five chapters center mainly around the question of how to make the best use of available water supplies; or conversely, how much water control and supply is required to obtain a certain objective. Chapter 11 pertains to the economic analysis that must be applied to alternative water development plans in order to find the one that will yield the greatest benefits. (Loeb-Rutgers)

FINANCIAL MANAGEMENT OF A WATER UTILITY,
Pate, Hirn and Bogue, Inc., Detroit, Mich.
Stuart H. Bogue.
American Water Works Association Journal Vol 60, No 3, p 267-272, March 1968. 6 p.

Descriptors: *Public utility, *Planning, *Financing, *Management, Demand, Water supply, Budgeting, Government, Political aspects, Investment, Interest rate, Debt, Bonds.
Identifiers: *Program development, *Record keeping, *Special assessments.

Water utilities have inadequate funding for operating a proper system. Some water utility expenses are outlined and three examples are given of successful and unsuccessful water utility management. The means of financing are explained with the emphasis on the different types of bond financing. The successful financial management of a water utility involves proper planning, thorough record keeping and careful decisions. The necessity of running a water utility on a sound basis to meet the increasing demands of its customers is stressed throughout. (Murphy-Rutgers)

PUBLIC ECONOMICS,
Oslo Univ. (Norway).
Leif Johansen.
Amsterdam, North-Holland Publishing Co, Chicago, Rand McNally and Co, 1965. 367 p.

Descriptors: *Taxes, Prices, Economics, Employment, Stabilization, Profit, Credit, Debt, Interest rate, Demand, Loans, Costs, Income, Depreciation, Welfare, Investment.
Identifiers: *Public finance, *Targets, *Instruments, *Macroeconomics, *Fiscal policy, *Public debt, *State budget, *State accounts, *Collective consumption, Public sector, Economic theory, Preference function, Private consumption, Collective wants, Economic growth, Income distribution, Price level.

The book treats economic theory in its relation to the problems of public economy and lays emphasis on principles and applications of theory rather than on description. As such, a complete description of national institutions, fiscal system and policy, and any systematic comparison between countries has been avoided. Facts and figures from Norway and other countries are used mainly to clarify points of principle, and to illustrate the practical importance of the problems which are treated. Simple economic models are employed in the book. A prior knowledge of some basic macro-economic theory and economic welfare theory is recommended. References to literature are given. The theoretical economic problems of water resources are contained in the public finance area and this book will be of aid to the researcher concerned with the underlying economic theory of public goods and public finance. (Loeb-Rutgers)

THE EFFECT OF FINANCIAL INDUCEMENTS ON THE LOCATION OF FIRMS,
Kentucky Univ., Lexington; and Rutgers - The State Univ., New Brunswick, N.J.
William J. Stober, and Laurence H. Falk.
Southern Economic Journal, Vol 36, No 1, p 25-35, July 1969. 11 p, 3 tab.

Descriptors: *Sites, Investment, Model studies, Costs, Taxes, Income, Interest rate, Capital, Labor.
Identifiers: *Financial inducement, *Analytical model, Investment decision, Lease payment, Least cost.

Despite the proliferation of state and local inducements to industrial development, little has been written on their observable or potential influence on location decisions. Generalizations regarding the importance of many other factors controlling the choice of location and analysis of replies to questionnaires submitted to inducement recipients dominate discussions of this matter and point to the uninformative and questionable conclusion that financial inducements are at best a marginal factor in the selection of a location. However, such variables as the growth in the size of firms receiving inducements suggest that financial inducements may indeed be an effective means of attracting industry. The purpose of this paper is to employ an analytical model to isolate the variables that determine the effectiveness of financial inducements. To this end, the investment decision and its relevance to locational choice is examined. Financial inducements are also incorporated into the model and their effect on relative costs determined. Finally, the model is more completely specified and numerical results are presented for representative cases. This paper has potential interest in the water area with respect to attracting water using industries and to assisting water supply developments. (Loeb-Rutgers)

NEW PRICE POLICIES FOR MUNICIPAL WATER SERVICE,
Indiana Univ., Bloomington.
Jerome W. Milliman.
American Water Works Association Journal, Vol 56, No 2, p 125-131, February 1964. 7 p, 5 ref.

Descriptors: *Marginal cost, *Water rates, *Pricing, *Economic efficiency, *Municipal water, Peak loads, Economic analysis, Joint costs, Separable costs, Fixed costs, Public utilities, Total cost, Investment.
Identifiers: *Cost-classification, *Equal-price rule, *Price discrimination.

Not enough thought has been given to the pricing principles and policies which should govern the efficient use and development of municipal water service. The tradition of low prices for municipal water service should be broken and attention should be given to better application of economic principles in the design of water rate schedules. The underlying principles important for economic efficiency are that consumers served under identical cost conditions should be charged equal prices and that waste service should be priced in such a way that the prices charged each class of service should equal the marginal costs of serving that class. The defect in much of the principles underlying water rates (i.e. that prices should cover the costs distributed to each class of user) is explained along with the applicable concepts of joint and separable costs. A conclusion is made that the present rate structure tends to generate inefficiency and waste of resources. (Murphy-Rutgers)

COMPARISON OF COSTS OF REMOTE CONTROL AND MANUAL OPERATION,
Gary-Hobart Water Corp., Gary, Ind.
Harry D. Harman.
American Water Works Association Journal, Vol 58, No 1, p 152-156, January 1966.

Descriptors: *Operating costs, *Profits, *Public utilities, Statistics, Economic feasibility, Investment, Engineering, Flow rates, Water quality, Management.
Identifiers: *Labor costs, *Remote-control equipment, *Telemetering equipment.

The article relates the possibilities inherent in telemetering and remote control equipment in the distribution system of water utilities for the purpose of increasing net profits and rates of return by lowering labor costs. The article tells of the experience of a new plant which was designed to minimize maintenance and operating costs and to use any and all tools that appeared to the economically sound. Several of these tools are described in the report and it was found that significant savings were realized. However, it was felt that the advantages and economics of remote-control operation would not be fully realized until further additions are made to the plant. (Murphy-Rutgers)

6D. Water Demand

THE CRITICAL BALANCE: SUPPLY VS DEMAND IN WATER USE,
Geological Survey, Washington, D.C.
C. Richard Murray.
Groundwater Resources Institute Quarterly, Vol 2, No 2, p 14-15, Winter 1969. 2 p, 1 fig, 1 tab.

Descriptors: *Water utilization, *Water supply, *United States, Consumptive use, Water reuse,

Economics, Water resources development, Groundwater, Surface waters, Water costs, Withdrawal, Recharge, Water balance.
Identifiers: Water demand-use relations.

Water supply-water use relationships in the U.S. are briefly reviewed. In 1965, 85% of U.S. water consumption took place in the relatively arid 17 Western States - where only a quarter of the country's supply is found. Increased dependability of supply generally can be obtained through water control measures, such as constructing reservoirs, controlling evaporation, or artificially recharging groundwater aquifers. Withdrawal of fresh ground and surface water in the 48 conterminous states in 1965 was 310 bgd, or approximately three-fourths the dependable fresh supply. Consumption was 77 bgd, about one-fifth the estimated dependable supply. All fresh-water withdrawals in the 17 Western States amounted to about 130 bgd, compared to about 150 bgd for the estimated dependable supply. Consumption amounted to about 66 bgd - 45% of the dependable supply. West of the Mississippi, only the Pacific Northwest has a very favorable supply-demand ratio. Low consumptive use and suitability of discharge water for reuse are important factors in determining to which use the water will be put as the competition for available supply increases. WATER FOR THE CITIES--THE OUTLOOK,
Geological Survey, Washington, D.C.
William J. Schneider, and Andrew M. Spieker.
Available free of charge from US Geological Survey, Washington, DC, 20240. Geological Survey Circular 601-A, 1969. 6 p, 5 ref.

Descriptors: *Urbanization, *Water distribution, Short-term planning, Water resources development, Treatment facilities, Cities.

Water resources are adequate to meet the anticipated future needs of cities. The demands for urban water, however, will place a heavy strain upon existing systems. Present city problems vis-a-vis water have been the result of overtaxed collection, storage and distribution systems. The governing criteria for most cities in solving their water problems have been short-range ones based upon 'crisis' reactions and minimum costs. Future development of water resources will have to consider regional demands and resources because of: (1) the rapid expansion of urban areas and the concomitant juxtaposition of units of governments; (2) overlapping political jurisdiction; and (3) competing demands for the water resource. (Starr - Chicago)

THE DEMAND AND SUPPLY OF OUTDOOR RECREATION, AN ECONOMETRIC ANALYSIS,
Rutgers - The State Univ., New Brunswick, N.J.
Charles J. Cicchetti, Joseph J. Seneca, and Paul Davidson.
New Jersey, Bureau of Economic Research, 1969. 310 p, 16 fig, 18 tab, 43 ref, 2 append.

Descriptors: *Theoretical analysis, *Demand, *Supply, *Recreation, Statistical methods, Model studies, Least squares method, Regression analysis, Statistical models, Recreation facilities, Planning, Estimating.
Identifiers: *Econometrics, *Socioeconomic characteristics, Mixed goods, Public goods, Private goods, Theoretical model, Reduced form, Two step technique, Identification, Bias, Heteroskedasticity, Probit analysis, Generalized least squares, Empirical model, Conditional probability, National Recreation Survey.

A theoretical analysis is presented of the private and public components of outdoor recreation and formulates the qualitative and quantitative characteristics of outdoor recreation as a commodity. An extension of a Musgrave implied mixed good analysis is used as the theoretical framework of the study. After determining the nature of the outdoor recreation good, a theoretical model of demand and supply is formulated using the results of the mixed good analysis. A discussion is presented pertaining to the econometric problems involved in such a study. A two step, conditional probability sub-sample activity day approach is used to examine 24 outdoor recreation activities in the empirical model. The 1965 National Recreation Survey and an inventory of recreational facilities, substitute goods, complementary goods and socioeconomic characteristic found in each county and state for each of the 2194 sample persons supplied the data. From the empirical model an applied model useful for planners at various governmental levels is determined. The final chapter presents an example of its use along with policy recommendations. The vital role of water resources in outdoor recreation and the potential benefit magnitudes of recreation activity in water projects make this article of interest to the water researcher. (Loeb-Rutgers)
W70-04511

RECREATIONAL TRIP GENERATION, A CROSS SECTION ANALYSIS OF WEEKEND PLEASURE TRIPS TO THE LAKE DISTRICT NATIONAL PARK,
Ministry of Transport, London (England).
N. W. Mansfield.
Journal of Transport Economics and Policy, Vol 3, No 2, p 152-164, May 1969. 13 p, 1 map, 7 tab, 5 ref, 1 append.

Descriptors: *Demand, Recreation, Cross-sections, Costs, Regression analysis, Elasticity of demand, Time.
Identifiers: *Recreational trip generation, *Pleasure trips, *Lake district, Traffic data, Day visitors, Half-day visitors.

The paper attempts to analyze the demand for day and half-day pleasure trips to a holiday area, by means of a model describing the generation of trips to alternative recreation facilities and holiday resorts. The main purpose of the paper is to make a cross-section analysis of a single year's traffic data in order to determine how much of the observed variation in trip demand during a single year can be attributed to a few simple factors affecting relative journey costs. The small sample size of the original data meant that only 15 separate observations of trip volumes were available. The author therefore, suggests that the quantitative results should be interpreted as only general indications of the responsiveness of demand to changes in the variables considered. This methodology might well be used to analyze day pleasure trips to water recreational areas in the United States. (Loeb-Rutgers)

AN INDUSTRIAL WASTE GUIDE TO THE COTTON TEXTILE INDUSTRY.
American Association of Textile Chemists and Colorists, Durham, N.C.

American Association of Textile Chemists and Colorists, National Stream Sanitation Committee and National Technical Task Committee on Industrial Wastes, Public Health Service publication 677, 1959, 23p.

Descriptors: *Cotton, *Sludge Disposal, *Filtration, *Neutralization, *Remedies, *Aeration, Waste water disposal, Waste water treatment, Activated sludge, Lagoons, Separation techniques, Chemical precipitation.
Identifiers: *Biological oxidation, *Slashing wastes, *Dyeing wastes, *Desizing wastes, *Scouring wastes, *Equilization, *Chemical oxidation, Trickling filters, Waste volume reduction, Process modification, Recovery (Wastes), Substitution of chemicals.

This publication is intended to assist operators and managers of cotton textile plants to analyze and solve their waste problems. A description of cotton processing and the sources of pollutants are given. A format for plant analysis discusses and recommends the following: (1) determine the magnitude of the waste problem; (2) find in-plant methods to reduce waste volume or polluting effects-for example, by re-use of water, segregation of wastes, lowering the amounts of process chemicals used, recovery and re-use of chemicals, substitution of chemicals, process modification, or simple good housekeeping; (3) determine the maximum waste load the receiving stream can accept; (4) consider the feasibility of combined treatment with domestic sewage; (5) determine which treatment method gives the best, most economical results. Methods discussed are the separation and differential treatment of wastes, equalization and storage, screening and mechanical filtration, aeration, neutralization, chemical precipitation, and chemical or biological oxidation. A bibliography is included. (Sheffield-North Carolina State Univ)
W70-04541

AN INDUSTRIAL WASTE GUIDE TO THE SYNTHETIC TEXTILE INDUSTRY,
American Association of Textile Chemists and Colorists, Durham, N.C.
Arthur L. Smith.
American Association of Textile Chemists and Colorists Committee of Stream Sanitation Technology, National Technical Task Committee on Industrial Wastes, United States Public Health Service, Washington, D.C., 1965, 23 p, 9 figures, 6 tables, 9 references, Public Health Service Publication No. 1320.

Descriptors: *Separation techniques, Waste treatment, Industrial wastes, Remedies, Biological treatment.
Identifiers: Synthetic fibers, Dyeing wastes, Rayon, Acetate, Polyamides, Polyolefins, Polyesters.

This publication summarizes waste problems associated with processing synthetic fibers and suggests methods of analysis and solutions for the problems. Pollutants from processing rayon, acetate, polyamides, acrylic, polyester, and polyolefin fibers include oils, detergents, finishing wastes, scouring bath wastes, dye wastes, and toxic compounds. Wastes should be checked for toxic materials that might be immune to treatment, discharge load should be determined from in-plant measurements and BOD in the stream should be checked under varying conditions. Two solutions to a waste problem are discussed: (1) reduction of waste through process control, good housekeeping methods, chemical substitution and recovery of components, and (2) treatment of wastes by solids separation or biological treatment. A bibliography is included. (Sheffield-North Carolina State Univ)

6E. Water Law and Institutions

PHYSICAL, LEGAL AND ECONOMIC ASPECTS OF ASSESSMENT OF COSTS AMONG DRAINAGE DISTRICTS: LEGAL PHASE,
Iowa Univ., Iowa City.
N. William Hines, and Frank W. Pechacek, Jr.
Available from the Clearinghouse as PB 189 767, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Iowa State Water Resources Research Institute, Dec 31, 1969. 77 p. OWRR Project B-005-IA.

Descriptors: Watershed management, *Legal aspects, Small watersheds, Land use, *Surface drainage, Supervisory control, *Costs.

Discusses the related problems of multi-purpose versus single purpose districts, and the allocation of costs and benefits. An intoductory background on allocation of costs reviews judicial development of the common law, common energy rule, the civil law rule of natural drainage, the reasonable use rule, and state statutes creating drainage districts. A more specific analysis of Iowa districts observes the piece-meal development of too many districts, often at cross-purposes or duplicative, and laboring under an inherently inequitable system of cost allocation based on the theoretically appealing economic benefit concept. The current legal apparatus is defined as archaic in terms of present population and technological demands. Recommends 'multi-purpose' approach to drainage management, which is joint participation by both upper-land and bottom-land owners with special emphasis upon use of soil-conservation and water-retention structures by the upper-land owners.
W70-04047

SOME ASPECTS OF THE WATER RESOURCES DEVELOPMENT IN INTERNATIONAL RIVER BASINS,
International Inst. for Land Reclamation and Improvement, Wageningen (Netherlands).
F. E. Schultze, and Ch. A. P. Takes.
Int Inst Land Reclam Impr, Annu Rep, p 5-11, The Neth, 1968. 7 p.

Descriptors: Compacts, Watersheds (Basins), Planning, International waters, Project planning, Policy matters, Foreign countries.
Identifiers: *Developing countries, *International river basin, Chad Republic, Mekong River Project, International projects.

Some aspects of international projects are discussed, with special reference to developing countries where outside technical and financial assistance is needed for designing and constructing basinwide water resources systems. Observations deal mainly with the organizational and operational aspects of the problem and reflect the work of the Chad Basin Commission and the Mekong Committee. To guarantee the most efficient use of water resources of a river basin, a basinwide approach to development is needed. When the basin falls under the jurisdiction of different countries, such an approach is more complicated because some specific and inevitable difficulties are encountered. These problems should be recognized and measures should be taken to reduce them. Two main factors that could reduce the difficulties are: (1) a powerful, well-staffed, and well-equipped administrative force; and (2) well-defined action programs. Much depends on the desire of participating countries for cooperation, and on an understanding that communal effort, rather than a shortsighted clinging to direct national interests, will lead to better results for all. GEORGIA WATER LAW (INTRODUCTION: HYDROLOGIC CYCLE; TERMINOLOGY),
R. C. Kates.
In: Georgia Water Law, Institute of Government, University of Georgia, Athens, Georgia, Chapter 1, p 1-14, 1969.

Descriptors: *Georgia, *Hydrologic cycle, *Hydrologic equation, *Water rights, Hydrologic aspects, Surface waters, Water resources, Legal aspects, Legislation, Judicial decisions, Groundwater, Watercourses (Legal), Rivers, Streams, Lakes, Ponds, Piers, Tidewaters, Navigable waters, Riparian rights, Prior appropriation, Accretion (Legal aspects), Avulsion, Fishing, Ownership of beds.
Identifiers: Definitions.

The increase in industrialization and population has created new and urgent problems of private water use and its public regulation. The last major codification of Georgia water law, which occurred in 1860, was not designed to cope with these problems. The purpose of this book is to examine existing Georgia water law. The content of the private right of water use depends upon the broad relationship between these uses and their resultant effect upon other uses. This relationship is expressed in the hydrologic cycle. This hydrologic equation is used herein to explore the resonableness of Georgia water law. Since they generally accord with the hydrologist's classification of water as it moves through the hydrological cycle, the existing legal categories of classification have been retained. These categories and terms are defined in this introduction and include: (1) surface waters; (2) diffused surface waters; (3) groundwaters; (4) watercourse, stream and river; (5) natural watercourse; (6) tidewaters; and (7) pond and lake. Also introduced are the concepts of: (1) navigability; (2) riparian rights; (3) prior appropriation; (4) accretion and avulsion; (5) wharfage rights; (6) fishery rights; and (7) bed ownership. (See Vol. 2 No. 15, Field 6E, entry W69-06009). (Marsee-Florida)

GEORGIA WATER LAW (HISTORICAL BASIS OF GEORGIA RIPARIAN WATER LAW),
R. C. Kates.
In: Georgia Water Law, Institute of Government, University of Georgia, Athens, Georgia, Chapter 2, p 15-23, 1969.

Descriptors: *Georgia, *Riparian rights, *History, *Natural flow doctrin, Relative rights, Obstruction to flow, Diversion, Consumptive use, Judicial decisions, Legislation, Legal aspects, Prior appropriation, Reasonable use, Riparian waters, Alteration of flow, Competing uses, Ownership of beds, Prescriptive rights, Usufructuary right, Water law, Navigable waters.

Georgia follows the modified riparian doctrine. That is, natural flow is subject to reasonable restricted uses. This doctrine emerged in Georgia in the decision of Hendrick v Cook, 4 Ga 241 (1848). It is important to understand various formulations of the riparian rights concept leading to this decision. Early common law attitudes are discussed, including attitudes toward: (1) diversion of water flow by riparian owners; (2) bed ownership; (3) interference with natural flow; (4) fishing rights; (5) prior appropriation; and (6) prescriptive use of nonnavigable stream waters. Early Georgia statutory law is examined as is English and American law immediately prior to 1848. Early law, both statutory and judicial, recognized the natural flow doctrine of riparian rights. However, the doctrine was gradually qualified to prevent the last downstream owners from exercising a virtual monopoly of the consumptive uses of the stream water. (See Vol. 2, No. 15, Field 6E, entry W69-06009). (Marsee-Florida)
W70-04201

GEORGIA WATER LAW (THE GEORGIA DOCTRINE OF RIPARIAN WATER RIGHTS),
R. C. Kates.
In: Georgia Water Law, Institute of Government, University of Georgia, Athens, Georgia, Chapter 3, p 24-84, 1969.

Descriptors: *Georgia, *Riparian rights, *Reasonable use, *Legislation, Judicial decisions, Relative rights, Obstruction to flow, History, Diversion, Consumptive use, Nonconsumptive use, Water pollution, Riparian land, Riparian waters, Navigable waters, Ownership of beds, Alteration of flow, Usufructuary right, State governments, Legal aspects, Impoundments, Irrigation, Domestic water, Competing uses, New York.

Beginning with the early case of Hendrick v Cook, 4 Ga 241 (1848), this chapter examines the development of the riparian rights doctrine in Georgia. The chapter discusses: (1) the 1860 Georgia codification of riparian law; (2) general considerations of reasonable use; (3) domestic uses; (4) irrigation; (5) the non-approved consumptive uses of detention, obstruction, addition of waters, physical injury to adjoining land and pollution; (6) Georgia's resonable use rule applied to modern impoundments; (7) rejection of the doctrine of balancing the conveniences; (8) protection of quasi-public uses; (9) competing uses by governmental subdivisions; and (10) the present riparian doctrine, its shortcomings, and the feasibility of remedial legislation modeled on the New York example. The proposed statute for Georgia provides; (1) that harmless use is not actionable; (2) for amendment of existing code sections; (3) for ownership of beds; (4) for the right of use of navigable bodies of water whose beds are owned by the state; (5) for a definition of riparian land; (6) for declaratory judgments; and (7) for a remedy for harm to riparian rights caused by interference with subsurface waters. (See Vol. 2, No. 15, Field 6E, entry W69-06009). (Marsee-Florida)
W70-04202

GEORGIA WATER LAW (WATER POLLUTION IN GEORGIA),
R. C. Kates.
In: Georgia Water Law, Institute of Government, University of Georgia, Athens, Georgia, Chapter 4, p 85-141, 1969.

Descriptors: *Georgia, *Water pollution control, *Pollution abatement, *Water quality control, Legislation, Pollution, Judicial decisions, State governments, Federal goverment, Cities, Industries, Industrial wastes, Coordination, Administrative agencies, Jurisdiction, Public rights, Regulation, Standards, Abatement, Federal jurisdiction, History, Costs, State jurisdiction.
Identifiers: Definitions.

Although compliance with the water purity standards set forth by the Federal Water Pollution Control Act could result in enormous expenditures by industries and municipalities, it is likely that the public will continue to strive for water pollution abatement. The purpose of this chapter is to study both public and private means of such abatement and to interpret recently enacted federal and state statutes and regulations. The chapter discusses: (1) early pollution regulation; (2) the definitions of pollution; (3) the basis of private liability; (4) civil liabilities of municipalities; (5) liability of industry;

(6) reform legislation; (7) exercise of the state's police power; (7) stream classification according to use; (8) quality standards and state enforcement thereof; (9) federal and state enforcement jurisdiction and procedures; (10) public regulation; and (11) private law suits as a deterrent to pollution. Often, judicial and administrative processes work at cross-purposes. What is needed in Georgia is a closer relationship between the courts and the regulating agency so that the powers of each may be effectively combined in the regulation of pollution. (See Vol. 2, No. 15, Field 6E, entry W69-06009). (Marsee-Florida)
W70-04203

GEORGIA WATER LAW (NAVIGABLE STREAMS, TIDEWATERS),
R. C. Kates.
In: Georgia Water Law, Institute of Government, University of Georgia, Athens, Georgia, Chapter 5, p 142-183, 1969.

Descriptors: *Georgia, *Navigable waters, *Tidewaters, *Relative rights, Ownership of beds, Federal jurisdiction, Federal government, State governments, Interstate compacts, Jurisdiction, Riparian rights, Regulation, Legislation, Legal aspects, Judicial decisions, Non-navigable waters, Navigable streams, Riparian lands, Riparian waters, Recreation, Navigation, Fishing, Watercourses (Legal), State jurisdiction, Federal-state water rights conflicts.
Identifiers: Constitutions, Powers.

Because of the size and number of navigable waterways and tidewaters in Georgia, the law relating thereto is of primary concern as important commercial, navigation, recreational, and fishing interests are determined thereby. Navigable streams, non-navigable tidewaters, and tidewaters are defined, and the chapter discusses: (1) the rights and liabilities of adjacent landowners in non-tidal navigable streams, navigable tidewaters, and non-navigable tidewaters; (2) ownership of beds; (3) 1863 Georgia legislation changing common law rights in navigable streams; (4) federal powers, restrictions and requirements; (5) the impact of federal powers on state water law; (6) the relation of federal law to state police power; and (7) the relation of federal law to individual property rights. Federal powers examined include: (1) the war power; (2) the taxing and general welfare powers; (3) the property clause powers; (4) interstate compact powers, and (5) powers relating to disputes between states. This chapter attempts to delineate the respective authority of federal and state governments in relation to Georgia waters, to explore the constitutional protections given private property from unauthorized governmental taking, and to analyze the rights of riparian owners on navigable streams. (See Vol. 2, No. 15, Field 6E, entry W69-06009). (Marsee-Florida)
W70-04204

GEORGIA WATER LAW (LAKES AND PONDS),
R. C. Kates.
In: Georgia Water Law, Chapter 6, p 184-209, Institute of Government, University of Georgia, Athens, Georgia, 1969.

Descriptors: *Georgia, *Lakes, *Ponds, *Relative rights, Ownership of beds, Navigable waters, Non-navigable waters, Fishing, Boating, Swimming, Legislation, Judicial decisions, Public rights, Reasonable use, Artificial watercourses, Land tenure, Regulation, Recreation, Recreation demand, Developed waters, Shores, Legal aspects.

The development of artificial or natural lakeside residential areas and the greater pressures of recreational needs in such waters increasingly call for clearer definitions of the legal rights of interested parties, including members of the public. However statutory and case law in Georgia provides little guidance in this area. This chapter examines the existing Georgia law and discusses: (1) title to the beds of artificial, natural, and non-navigable lakes and ponds; (2) rights of owners of beds of lakes and ponds; (3) the right of adjacent owners to reasonably use the surface waters of non-navigable lakes; (4) existing public regulation relating to use of non-navigable lakes; (5) legal theory to support additional regulation relating to use of non-navigable lakes; (6) public rights in lakes and their possible extension; and (7) regulation of fishing, boating, and bathing. The desirability of public development of lakes, ponds, and shoreline is weighed against private development thereof. (See Vol. 2, No. 15, Field 6E, ENTRY W69-06009). (Marsee-Florida)
W70-04205

GEORGIA WATER LAW (DIFFUSED SURFACE WATERS),
R. C. Kates.
In: Georgia Water Law, Chapter 8, p 210-226, Institute of Government, University of Georgia, Athens, Georgia, 1969.

Descriptors: *Georgia, *Surface runoff, *Surface waters, *Relative rights, Drainage, Beneficial use, Judicial decisions, Legislation, Legal aspects, State governments, Obstruction to flow, Repulsion (Legal aspects), Civil law, Riparian rights, Impoundments, Drainage water, Riddance (Legal aspects), Discharge (Water), Prescriptive rights, Diffusion, Evaporation.
Identifiers: Definitions.

Diffused surface waters are distinguished from natural watercourses in that the former have no natural boundaries or permanency and are not part of any defined surface or subterranean stream of water. Their source is precipitation, melting snow or percolation from the ground. They differ from groundwaters in that they are found on the surface of the earth and are temporary in nature, being evaporated or diffused by natural drainage. Most surface water law is concerned with land drainage rights and liabilities between private parties. In Georgia the law of surface waters is the product of judicial decision rather than statute. That decisional law is examined herein within the framework of the opposing common enemy and civil rule theories. The chapter discusses: (1) the general drainage law in Georgia; (2) discharge of surface water by artificial means; (3) case law and statutory law; (4) obstruction of flow and prescription; (5) pollution; (6) beneficial use; and (7) the relation of the right of collection for beneficial use to the law of riparian rights. (See Vol. 2, No. 15, Field 6E, entry W69-06009). (Marsee-Florida)
W70-04206

GEORGIA WATER LAW (SUBTERRANEAN WATERS, PERCOLATING WATERS SUBTERRANEAN STREAMS, SPRINGS),
R. C. Kates.
In: Georgia Water Law, Chapter 8, p 227-244, Institute of Government, University of Georgia, Athens, Georgia, 1969.

Descriptors: *Georgia, *Underground streams, *Percolating water, *Subsurface waters, Legal aspects, Springs, Legislation, Judicial decisions, Reasonable use, Wells, Well regulation, Hydrologic cycle, Hydrologic equation, Relative rights, Land tenure, Underflow, Underground, Water sources, Regulation, Social change, Groundwater, Water table, Water resources.

Because of the inherent difficulties in demonstrating with legal precision the physical characteristics of underground waters, such waters have been assigned an arbitrary legal classification that disregards the hydrological interrelationship of diffused surface waters, subterranean stream, and natural surface bodies. Georgia cases give little consideration to the lowering of a water table through excessive withdrawals of groundwater. The concept of absolute dominion over underlying groundwaters is a product of social and economic conditions existing when water was plentiful and population pressures few. A change in these factors requires a re-examination of the prior decisional law in Georgia. This chapter discusses Georgia decisional and statutory law as it relates to: (1) absolute ownership, reasonable use and correlative rights in percolating waters; (2) subterranean streams; (3) springs and wells; and (4) regulation of underground waters. The chapter concludes that the existing Georgia law of property rights in underground waters, as well as the public regulation thereof, is inadequate. This is partially caused by the courts' failure to expressly adopt the reasonable use rule. A statute relating to the use of underground waters is proposed for enactment. (See Vol. 2, No. 15, Field 6E, entry W69-06009). (Marsee-Florida)
W70-04207

GEORGIA WATER LAW (PROCEDURES AND REMEDIES),
R. C. Kates.
In: Georgia Water Law, Chapter 9, p 245-305, Institute of Government, University of Georgia, Athens, Georgia, 1969.

Descriptors: *Georgia, *Legal aspects, *Remedies, *Adjudication procedure, Water quality control, Legislation, Judicial decisions, Regulation, Governments, State governments, Federal government, Administrative agencies, Assessments, Drainage districts, Pollution abatement, Condemnation, Permits, Public rights, Damages, Administration.

As related to Georgia water law, this chapter discusses: (1) state proceedings; (2) parties at interest; (3) pleadings; (4) measure of damages; (5) injunctions; (6) involvement of the public interest; (7) procedure under the Water Quality Control Act; (8) permits; (9) pollution abatement; (10) condemnation proceedings; (11) statutory procedures; (12) remedies; (13) federal condemnation proceedings; (14) special assessments for drainage districts; and (15) formation of agency regulations. (See Vol. 2, No. 15, Field 6E, entry W69-06009). (Marsee-Florida)
W70-04208

GEORGIA WATER LAW (ADMINISTRATIVE STRUCTURE OF WATER USE AND WATER COURSES REGULATION),
R. C. Kates.
In: Georgia Water Law, Chapter 10, p 306-331, Institute of Government, University of Georgia, Athens, Georgia, 1969.

Descriptors: *Georgia, *Administrative agencies, *Regulation, *Administration, Coordination, Institutions, Organizations, Adjudication procedure, Federal government, Permits, State governments, Administrative costs, Leadership, Interstate commissions, Cities, Drainage districts, Water districts, Water users, Southeast U.S., Atlantic Coastal Plain, Public health, Fishing, Agriculture, Forestry.

Besides the Water Quality Control Board, numerous other non-federal units and agencies in Georgia are empowered to exercise varying degrees of control over water use. Many of these bodies are classified in this chapter according to the level of government at which the particular controls are exercised: (1) agencies functioning interstate; (2) state departments and commissions; (3) special purpose districts; (4) counties, municipalities and other public corporations; and (5) quasi-public corporations. Bodies discussed include: (1) Atlantic States Marine Fisheries Commission; (2) Resources Advisory Board; (3) Commission on Interstate Cooperation; (4) Southeastern Basin Inter-agency Committee; (5) Department of Agriculture; (6) Division of Conservation; (7) Department of Industry and Trade; (8) Department of Public Health; (9) Game and Fish Commission; (10) Forestry Commission; (11) Georgia Recreation Commission; (12) Mineral Leasing Commission; (13) Public Service Commission; (14) Rivers and Harbors Development Commission; (15) Soil and Water Conservation Commit-

tee; (16) drainage districts; (17) soil and water conservation districts; (18) sanitation districts; (19) counties; and (20) municipalities. The chapter also examines recent reorganizational developments in the administrative structure of Georgia water use control, and notes overlaps of authority and duplications of functions. (See Vol. 2, No. 15, Field 6E, entry W69-06009). (Marsee-Florida)
W70-04209

WATERWAYS AND MILLDAMS.
Ky Rev Stat Ann secs 182.170-182.240 (1963).

Descriptors: *Kentucky, *Condemnation, *Mill dams, *Dams, Legislation, State governments, Dam construction, Administrative agencies, Flood control, Damsites, Regulation, Boundaries (Property), Condemnation value, Cost repayment, Economic impact, Industrial use (Water), Riparian rights, Legal aspects, Canals, Navigation, Fish passages, Public health.

In order to build a mill or factory, a riparian landowner may obtain permission and acquire sufficient land by condemnation to build a dam across any watercourse on which his property is located and whose bed is owned by him or the state. Condemnation proceedings are to be in accordance with this act and brought in the county in which the condemned lands are situated. The appointed condemnation commissioners must report to the county court their findings as to: (1) what ought to be the height of the dam; (2) whether homes or gardens will be overflowed; (3) whether navigation and fish passage will be obstructed; (4) whether health conditions will be impaired; (5) a metes and bounds description of the lands to be taken; (6) what would be just compensation for the lands taken; and (7) whether a mill or factory would be helpful to the public. Permission to construct is within the court's discretion. Servient landowners may construct any structure which will not interfere with permitted water flow. No vested water interests may be violated. Time limitations on building the dam and mill or factory are imposed. (Barnett-Florida)
W70-04220

DESTROYING BRIDGES AND INJURING CANALS.
Va Code Ann secs 18.1-81, 18.1-147 (1960).

Descriptors: *Virginia, *Bridges, *Dams, *Canals, Legislation, Locks, Damages, Burning, Explosives, Explosions, Public utilities, Electric power, Electric wires, Electric switches, Legal aspects, Obstruction to flow.
Identifiers: Penalties (Criminal).

Burning or in any way maliciously destroying any bridge, lock, or dam is made punishable by imprisonment for from one to ten years. It is declared unlawful to maliciously obstruct or damage canals, electric power lines, or bridges. (Schram-Florida)
W70-04222

DREDGING OR SCRAPING FOR OYSTERS.

Va Code Ann secs 28.1-128 thru 28.1-135 (1969).

Descriptors: *Virginia, *Oysters, *Administrative agencies, *Dredging, Legislation, Administrative decisions, Regulation, Commercial shellfish, Shoals, Beds, Ownership of beds, Permits, Boats, Taxes, Tax rate, Legal aspects, Commercial fishing.
Identifiers: *Dredging equipment, *Oyster beds.

It is declared unlawful: (1) to take and catch oysters with dredges and scrapes from any public rocks, beds, or shoals; (2) to have dredging equipment aboard a boat unless a dredging license or permit is available for inspection on the boat; and (3) to allow licensed dredging equipment to be transported on board a boat except in certain instances. The Marine Resources Commission may authorize the use of dredges upon public beds and shoals of Tangier Sound during December, January, and February. The procedures for applying and issuing dredging licenses are detailed. Taking or catching oysters, except with ordinary oyster tongs or by hand, is prohibited and declared a felony. A license tax for dredging is provided. Dredging or scraping for oysters upon private oyster-planting grounds by those licensed for such activities is permitted under stated conditions. This privilege is further conditioned upon properly marking the oyster lines of the planting grounds with fixed buoys. The Marine Resources Commission is authorized to revoke all permits and licenses for one year for violation of these dredging provisions. A hearing is required for such revocation. (Schram-Florida)
W70-04224

OYSTER REGULATIONS.

Va Code Ann secs 28.1-136 thru 28.1-142 (1969).

Descriptors: *Virginia, *Shellfish, *Oysters, *Clams, Legislation, Administrative agencies, Administrative decisions, Commercial fishing, Crabs, Commercial shellfish, Legal aspects, Lime, Measurement, Regulation, Permits, Marine fisheries.

It is illegal to carry away oysters or clams or to take shells or seeds that have been planted for the formation of oyster beds. Anyone found guilty of taking oysters from public grounds shall, without notice or hearing, have any existing licenses to take or catch finfish or shellfish revoked. No new licenses shall be issued to such person for a minimum of one month. Except with the permission of the Marine Resources Commission, it is unlawful to take or catch oysters or shells for the purpose of converting them into lime. Taking or loading shellfish on Sunday nights is prohibited. It is unlawful to sell or distribute oysters or clams as Virginia oysters or clams unless they have been in the waters of Virginia for at least six months. It is unlawful for any boat licensed to catch crabs with a dredge to allow more than one bushel of oysters on board. (Schram-Florida)
W70-04225

FISH, OYSTER, AND SHELL FISH.
Va Code Ann secs 28.1-143 thru 28.1-159 (1969).

Descriptors: *Virginia, *Oysters, *Shellfish, *Administrative agencies, Legislation, Chennels, Channel improvement, Dredging, Leases, Beds, Ownership of beds, Navigable streams, Rivers, Shoals, Crabs, Clams, Agriculture, Commercial shellfish, Width, Depth, Length, Boundaries (Property), Surveys.
Identifiers: *Advisory reports.

It is unlawful to use rakes or scrapes to take oysters, crabs, clams, or shells from the beds, rocks, and shoals on the ocean side of Accomack and Northampton counties. The deep water planting grounds of the James and Rappahannock rivers are part of the public oyster beds and may not be leased or assigned by the Commission of Fisheries. Dredging for oysters in the James River is prohibited unless a permit has been granted. After receiving advisory reports from various state agencies, the Governor may authorize the dredging of channels of navigable streams whose beds are owned by the state. Channel improvements in the James River must be approved by the General Assembly. Certain areas are declared to be natural oyster rocks, beds, and shoals and are made unassignable for private use. Detailed descriptions of these areas are included. Certain acts declaring other areas to be natural oyster beds, rocks, and shoals are continued in force. (Schram-Florida)
W70-04226

COUNTY BRIDGES.

Ohio Rev Code Ann secs 5591.01 thru 5591.44 (Page, 1953).

Descriptors: *Ohio, *Bridges, *Bridge construction, *Local governments, Legislation, Legal aspects, Railroads, Bridge design, Administration, Streams, Canals, Boats, Highways, Road construction, Construction, Costs, Tax rate, Easements, Taxes, Cities, Bodies of water

The board of county commissioners must construct and repair all necessary bridges over streams and public canals in municipal corporations not participating in the bridge fund. They may also issue bonds, which may be submitted to the electorate; acquire all lands and easements necessary; construct and maintain swing or lift bridges; purchase toll bridges; maintain and operate a free ferry; and, may enter into contracts with railroad companies for the joint construction, operation and use of bridges designed to carry railroad and general highway traffic. The board may establish new highways and approaches to bridges and may modify or alter existing bridges, highways and approaches. Authority is granted to these boards to maintain suits for damages to bridges under their control. (Casey-Florida)
W70-04227

SOUTH VENICE CORP V CASPERSEN (OWNERSHIP OF BEDS).
229 So 2d 652-657 (2d DCA Fla 1969).

Descriptors: *Florida, *Ownership of beds, *Boundaries (Property), *Boundary disputes, Nonnavigable waters, Navigable waters, Islands, Swamps, Bulkhead line, Dredging, Beds under water, High water mark, Watercourses (Legal), Legal aspects, Judicial decisions, Riparian rights, Bays.

Defendant corporation applied for a permit to establish a bulkhead line and dredge fill for an area which included an island and a portion of the submerged bottom of Lemon Bay in Sarasota County. Plaintiff Caspersen sought determination that he was the owner of the island and the submerged bottom. Plaintiff had earlier conveyed property 'east of Lemon Bay' to defendants. The trial court held that the portion of Lemon Bay in question was nonnavigable. Therefore, plaintiff was the owner of the submerged beds. The common property line between plaintiff's and defendant's tracts of land was the mean high water line of Lemon Bay adjacent to defendant's uplands. The island in question, being at the mouth of a creek, was in the bay and not in the creek, and therefore was not covered by the conveyance. The appellate court affirmed, holding that the bed of the non-navigable bay was in effect 'swamp and overflowed lands'. As land generally does not pass under a deed as appurtenant to land, the submerged beds did not pass to defendant under the riparian rights included in the original conveyance. The court held that as the bay was non-navigable, plaintiff validly had title to the submerged beds and the proper boundary between defendant's uplands and plaintiff's beds was the mean high water line of the bay. (Caldwell-Florida)

RAFTS AND BOOMS - INCORPORATION OF COMPANIES.
Mo Ann Stat secs 422.010, 422.070, 422.090 thru 422.120, 422.160 thru 422.180, 422.210 thru 422.230 (1952).

Descriptors: *Missouri, *Lumbering, *Water rights, *Lumber, Industries, Water management (Applied), Legislation, Legal aspects, Forest management, Construction materials, Pulp and paper industry, Engineering structures, Navigable waters, Streams, Rivers, River systems, Water utilization.
Identifiers: *Booms.

Any five or more persons associated for the purpose of engaging in and carrying on the business of running, driving, booming and rafting logs, timber, lumber, and other floatables on any Missouri waters or for constuction of booms across or in any such waters, may be incorporated. Every corporation is authorized to construct, use and maintain all

necessary booms for the business of such corporation. Such corporations have the power to carry on the business of driving, booming, rafting and running logs, timber, lumber or other floatables. In conducting the above activities, the corporation has a lien on the logs, timber or other floatables driven, boomed, rafted or run. The corporation is entitled to retain the possession of such logs, timber, lumber or other floatables or so much thereof as may be necessary to satisfy operational charges. Any corporation may break jams of logs, timber or lumber in or upon rivers, creeks, or streams. Specific provisions prescribe a system of marking logs, lumber or other timber. The recovery of drifted timber is regulated. (Powell-Florida)
W70-04235

RECREATION, FISH, WILDLIFE FACILITIES.

Mo Senate Bill No 58, Act 91 (Legis Service No 2, 1969).

Descriptors: *Missouri, *Recreation, *Recreation facilities, *Wildlife, Legislation, Administrative agencies, Administrative decisions, Reservoirs, Federal government, Federal project policy, Cost sharing, Projects, Contracts, Costs, Reservoir management, Wildlife conservation, Reservoir fisheries, Multiple-purpose reservoirs, Reservoir operation, Separable costs, Water policy, Maintenance, Natural resources, Conservation, Water resources development.

The Missouri Federal Water Projects Recreation Fund is created. The General Assembly of Missouri may transfer money from the General Revenue Fund to the Recreation Fund and may appropriate money from the Fund to pay non-federal costs associated with the enhancement of recreation and fish and wildlife benefits on federal reservoir lands and waters as required by the Federal Water Projects Recreation Act. Unexpended balances in the Fund at the end of the appropriation period shall not be transferred to the General Revenue Fund. The Interagency Council for Outdoor Recreation shall make an annual report containing all reports and recommendations submitted to the Council from the responsible state agencies. The Council, with the approval of the pertinent state agency, may enter into agreements to administer federal project land and water areas for recreation or fish and wildlife enhancement in accordance with the Federal Water Projects Recreation Act. The Council may indicate the intent of Missouri to bear not less than one-half of the separable costs of the project allocated to those purposes and to bear all operation, maintenance, and replacement costs. NAVIGATION: WATER TRANSPORTATION (BOAT REGISTRATION, COMMON CARRIERS).

NH Rev Stat Ann secs 270:1 thru 270:9 (1966), as amended, (Supp 1967).

Descriptors: *New Hampshire, *Boats, *Permits, *Navigation, Administrative agencies, Taxes, Inspection, Equipment, Buoys, Transportation, Navigable waters, Inland waterways, Tidal waters, Public health, Safety, Assessments, Engineering personnel, Personnel, Government finance, Public utilities, Boating regulations, Boating, Legislation, Rates.
Identifiers: *Registration, *Common carriers, Obstruction to navigation.

Boat dealers may be assigned a general registration certificate and number to be used on all boats and motors kept for sale. Any boat propelled by a gas, gasoline or naphtha engine or motor, except when operated in a licensed boat race, must be equipped with an under-water exhaust or other muffling device. It is unlawful to remove or injure any buoy, beacon or other aid to navigation or to moor any vessel thereto. It is also unlawful to place any obstructions to navigation in the navigable waters of the state. Any prearranged boat race must be approved and licensed by the Director of Safety Services. (Dearing-Florida)
W70-04327

NAVIGATION: WATER TRANSPORTATION (BOAT REGISTRATION AND REGULATION).

N H Rev Stat Ann secs 270:10 thru 270:17-a (1966).

Descriptors: *New Hampshire, *Boats, *Permits, *Boating regulations, Boating, Transportation, Public utilities, Personnel, Administrative agencies, Decision making, Administrative decisions, Legal aspects, Inspection, Equipment, Taxes, Government finance, Training, Accidents, Legislation, State governments, Political aspects, Safety.
Identifiers: *Reports, *Records, Hearings.

The Public Utilities Commission may require common carriers by water to submit annual reports, keep records and exhibit all accounts and records to the Commission. The Director of Safety Services may: (1) make and enforce rules and regulations concerning the personnel, operation, and equipment of any boat in public waters; (2) regulate the maximum horsepower of boat engines or outboard motors, and the speed limits in public waters; and (3) prohibit the use of motor boats on small waterbodies. Certificates granted to commercial boats or their personnel and any boat registration may be revoked and criminal sanctions imposed for violation of this act or any rules or regulations prescribed by the Department of Safety. Power boats owned by non-residents and registered in a contiguous state may be operated in this state without additional registration if the registering state reciprocates. (Dearing-Florida)

MILLER V PRARIE CANAL CO (ACCESS RIGHTS OF OWNER OF CANAL EASEMENTS).

229 So 2d 752-755 (3d Cir La 1969).

Descriptors: *Louisiana, *Canals, *Easements, *Damages, Right-of-way, Access routes, Maintenance, Relative rights, Levees, Conveyance structures, Repairing, Channel improvement, Width, Project purposes, Land use, Non-consumptive use, Reasonable use, Canal embankments, Remedies, Legal aspects, Judicial decisions, Competing uses.
Identifiers: Right of access.

Plaintiff landowner brought action against defendant owner of canal servitude through plaintiff's land for damages to land and fences arising out of an alleged trespass when defendant entered plaintiff's land to clean and maintain the canal and construct new levees. From a verdict for defendant, plaintiff appealed. The court affirmed and held that defendant's ownership of the canal right-of-way implicitly carried with it a right to use the canal for its intended purpose without the consent of the owner, and concluded that the owner of a canal easement had the right to enter plaintiff's property without his consent as a means of access to the canal for the purposes of cleaning, maintenance, and construction. The canal owner had no right to cause unnecessary damage to the plaintiff's land, but as it was not shown that the canal was unnecessarily widened beyond the reserved right-of-way, or that plaintiff suffered unnecessary damage to his land or fences in construction of the new levees, the trial court properly found for defendant. (Caldwell-Florida)

NAVIGATION: WATER TRANSPORTATION (BOAT REGISTRATION AND REGULATION, NAVIGATION).

N H Rev Stat Ann secs 270:18 thru 270:30 (1966).

Descriptors: *New Hampshire, *Boats, *Boating regulations, *Permits, Regulation, Legal aspects, Payment, Recreation, Navigation, Buoys, Safety, Navigable waters, Aircraft, Administrative agencies, Streams, Boating, Water sports, Legislation.
Identifiers: Beacons.

The Director of Safety Services, Department of Safety, shall supplement United States inspection laws by inspecting all commercial and private boats on public waters. The Director shall also supervise navigation safety and navigation aids including all lights and buoys. Registration of all commercial and private boats and all outboard motors is required. Fees are required for such registration, for inspection of commercial vessels, and for the issuance of boat operator's licenses and dealers certificates. Boats operating as common carriers with regular routes and schedules on the public waters must be authorized to do so by the Public Utilities Commission. Application for such authorization will be granted if the need for such service is shown and if the applicant is fit, willing, and able to perform the service and to conform to the applicable rules. Every common carrier by water shall establish, publish and maintain rates for transportation of passengers or property. (Dearing-Florida)

BRIDGE CORPORATIONS.

Mo Ann Stat secs 351.035, 351.040 (1963).

Descriptors: *Missouri, *Bridges, *Cities, Legislation, Bridge construction, Streams, Rivers, Land use, Eminent domain, Structures, Contracts, Local governments, Transportation, Mechanical equipment, Roads, Access routes, Damages, Operation and maintenance.

Bridge corporations are authorized to construct and maintain bridges for public use over streams within or bordering the state or within any adjoining state. The construction and operation of toll bridges is authorized. Bridge corporations are given the power to charge reasonable tolls and construct access routes to the bridge. The consent of municipal authorities must be obtained for the construction of such bridge within city limits. The power to make contracts for the use of the corporation's property by lease or otherwise is expressly granted. Such bridge corporation has the power to construct and maintain approaches for said bridge or viaduct in any street or alley of any such incorporated city or town in this state. In effect, this gives the bridge company the power of eminent domain, subject to the consent of the municipality involved. Such consent may not be granted until all damages to abutting property have been ascertained and paid. (Caldwell-Florida)

ABANDONMENT OF ROADS FOR FLOODING.
Va Code Ann secs 33-82 thru 33-95, 33-97 (1953).

Descriptors: *Virginia, *Highway relocation, *Dams, *Cities, Legislation, Highways, Right-of-way, Road construction, Roads, Flood control, Floodgates, Flooding, Flood damage, Submergence, Spillways, Water works, Water supply, Earth dams, Dam construction, Dam design, Dam failure, Dam foundations, Floodgates, Streams, Obstruction to flow.

State roads flooded by the expansion of a municipal water works system outside its corporate limits may be abandoned only if the city has complied with the procedures provided. Upon approval of the relocation by the county, the city submits relocation plans to the State Highway Commission. Upon approval of the plans by the Commission, the city acquires rights of way and constructs the highway at its own expense. Upon completion, the highway becomes a part of the state highway system. Owners of dams are required to maintain those supporting state highways. The Commission may widen or strengthen dams or bridges to support traffic. If a dam is washed out, the owner may pay a portion of the cost of reconstruction to the Commission. If he refuses, the Commission may reconstruct the highway without the owner's consent. If a dam is partially washed away because of an inadequate spillway, it may not be restored unless the spillway is improved, in part at state cost. Statutes declaring certain streams to be highways are continued in force. (Douberley-Florida)

HIGHWAYS, BRIDGES AND FERRIES.
Va Code Ann secs 33-169 thru 33-171, 33-174 thru 33-178, 33-181, 33-182, 33-191, 33-202, 33-203 (1953).

Descriptors: *Virginia, *Rivers, *Boats, *Transportation, Legislation, Regulation, River regulation, Streams, Highways, Transfer, Eminent domain, Interstate rivers, Navigable rivers.
Identifiers: *Ferries.

A fine is provided for transporting persons or property on a watercourse within one half mile of a lawfully established ferry. The operator of a ferry on a watercourse bounding the state and within two miles of an authorized ferry must pay the lawful operator a sum for each crossing. A person who wishes to establish a ferry must post a public notice and apply to the county or municipal court. Viewers are appointed to determine whether public convenience will result from the proposed ferry. If the watercourse divides two counties or a county and a city, applications must be made to both governmental units. No ferry may be authorized within half a mile of another ferry. A penalty is provided for operating a ferry without the proper authority. When a ferry which transports vehicles as a part of a highway system cannot or is not being operated, the highway commissioner upon approval by the Governor may acquire the ferry and necessary facilities by eminent domain for temporary use by the highway system. (Douberley-Florida)

APPROPRIATION OF PROPERTY.

Ohio Rev Code Ann sec 719.01 (Page 1953), as amended, (Supp 1970).

Descriptors: *Ohio, *Cities, *Real property, Legislation, Levees, Wharves, Aqueducts, Canals, Ditches, Drains, Sewers, Sewage treatment, Waste treatment, Sewage disposal, Water supply, Appropriation, Reservoir storage, Pumping plants, Water wells.

Any municipal corporation may appropriate, enter and hold real property within its limits for levees, wharves, landings, bridges and aqueducts. Property may also be held for constructing or improving any canal or watercourse not owned by the state or by an individual authorized to make improvements. Other authorized purposes for holding land include sewers, drains, ditches, and sewage disposal plants. To provide for a water supply, a municipality may appropriate property within or without its limits. (Douberley-Florida)
W70-04531

HAUSEY V RONALDSON (BOUNDARY DISPUTES).
228 So 2d 759-763 (1st Cir 1969).

Descriptors: *Louisiana, *Boundary disputes, *Boundaries (Property), Islands, Real property, Legal aspects, Swamps, Bogs, Marshes, Surveys, Bayous, Rivers, Junctions, Boundaries (Surfaces), Streams, Drainage programs, Drainage, Drainage effects, Dredging.
Identifiers: *Natural boundaries.

Plaintiffs sought a declaratory judgment to determine the true ownership of a portion of an island. The plaintiffs' claim to the land was based on record title and possession. The defendants' contention was based on a deed which had conveyed to defendants' predecessor in title 203 acres of land. Defendants asserted that the disputed 29 acres made up the balance of the 203 acres described in their chain of title. In affirming the decision of the trial court, the Court of Appeal of Louisiana held that the natural boundaries described in the plaintiffs' chain of title were superior to defendants' quantity calls. The court ruled that both chains of title contained unclear boundary descriptions but granted judgment to the plaintiffs based upon their chain of title which particularly recited that the property extended to and was bounded by the Comite River on the south. Defendants additionally asserted that by granting title to the disputed land to the plaintiffs, the quantity of acreage described in the plaintiffs' chain of title would be exceeded. The court declared, nowever, that the natural boundaries described in plaintiffs' chain of title required such a finding. (Schram-Florida)

ECOSYSTEM SCIENCE AS A POINT OF SYNTHESIS,
S. Dillion Ripley, and Helmut K. Buechner.
Daedalus, Vol 96, No 4, p 1192-1199, Fall 1967. 2 ref.

Descriptors: *Ecosystems, *Methodology, *Planning, Ecology, Environment.
Identifiers: Levels of integration, Points of view.

A two-dimensional conceptual model is presented, based on levels of integration and points of view, as an aid in orienting knowledge with relevance to the ecological crisis. The first dimension of the model considers levels of biological integration in terms of ecosystems. Biological entities, such as cells, organisms, populations, and communities, represent levels of integration in which the whole is more than a mere sum of the parts. Any of these levels of integration can be considered an ecosystem if the total environment is added as an integral part of the system. The societies of man, together with their total environment, form the highest level of biological integration. Man's societies dominate all ecosystems on earth. Accordingly, we need to concentrate our orientation of knowledge on the human-society-plus-environment level of integration because of its relevance to the central world problem of achieving a reasonably steady state between human societies and the finite resources of our planet. The second dimension of the conceptual model concerns points of view. Any entity may be studied from the following points of view: (1) the components of the system; (2) structure or morphology; (3) functions and processes; (4) distribution in time; (5) distribution in space; (6) relationships to environment; and (7) classification. These are related to the human-society-plus-environment level of integration. (Davis-Chicago)

REDEFINITION OF SALINITY,
Scientific Committee on Oceanic Research (Gt. Brit.); International Council for the Exploration of the Seas; and International Association for the Physical Sciences of the Ocean.
Warren S. Wooster, Arthur J. Lee, and Gunter Dietrich.
Journal of Marine Research, Vol 27, No 3, p 358-360, Sept 15, 1969. 3 p, 6 ref.

Descriptors: *Sea water, *Salinity, *Analytical techniques, *Conductivity, *Water analysis, Water properties, Water chemistry, Electrolytes.
Identifiers: Salinity determination, Chlorinity.

With the development of precise methods for measuring the electrical conductivity of seawater, it has become possible to consider a new definition of salinity based on conductivity. In October 1966, International Oceanographic Tables (UNESCO 1966) were published jointly by UNESCO and the National Institute of Oceanography in Great Britain. These Tables contain a new definition of salinity. In October 1967, the Tables, the definition of salinity, and the stated relationship between salinity and chlorinity were endorsed by IAPSO, which recommended that they be used by oceanographers and that all future oceanographic data reports include an explicit statement of the particular tables used in determining the values of the salinity reported. The conductivity method is now widely used in determining salinity, and the redefinition of salinity is required for its use. (Knapp-USGS)

INFLUENCE OF METHOD FOR REMOVAL OF SESTON ON THE DISSOLVED ORGANIC MATTER,
Washington Univ., St. Louis, Mo. Dept. of Botany.
Bruce C. Parker.
Journal of Phycology, Vol 3, No 4, p 166-173, 1967. 2 tab 20 ref.

Descriptors: *Analytical techniques, *Organic matter, *Seston, Water chemistry, Chemical analysis, Plankton, Filtration, Centrifugation, Dialysis, Scenedesmus, Adsorption, Activated carbon, Missouri, Eutrophication, Lakes, Water pollution effects, Dinoflagellates, Diatoms, Vitamin B, Phytoplankton.
Identifiers: *Organic solutes, Microcystis aeruginosa, Millipore filtration, Continuous-flow centrifugation, Biodialysis, Membrane filters, Scenedesmus quadricauda, Protosiphon botryoides, Paramecium bursaria, Westchester Lake (Mo), Beckman Infrared Carbon Analyzer, Ceratium, Peridinium, Synedra, Fragillaria, Coelastrum, Ankistrodesmus, Trachelomonas, Selas silver membranes, Whatman glassfiber filters, Vitamin B-12, Gelman Metricel filters.

Study of organic solutes in natural waters necessitates removal of seston (particulate organisms and detritus). Usual methods of sample treatment, including filtration and centrifugation, influence composition of water samples, but such problems are little studied and techniques are not standardized. Described are studies of some combinations of sample treatment and storage for laboratory cultures and naturally occurring samples which compare total dissolved carbon remaining after removal of seston. Results indicate that cellulose ester filters contain elutable carbon, removable with prewashing. Filtration to dryness may injure cells and release carbon to filtrates. Significant differences in retention exist between filters with pore sizes of 0.22 and 0.45 microns. Although both have limitations, most satisfactory methods were: wet filtration through prewashed Millipore filters (0.22 microns), and continuous flow centrifugation at 10,000-fold gravity and flow rate of 100 milliliters/minute. Ordinary centrifugation fails to remove some buoyant cells and may cause others to leak carbon. Evidence suggests that newly developed biodialysis technique may be more satisfactory than pre-existing methods. In this technique, a chamber, containing sterile distilled water retained between membrane filters, is placed in situ; dialysis of organic solutes from ambient water into chamber proceeds to equilibrium, while seston is excluded. (Eichhorn-Wisconsin)

ROTARY FLOW METER AS TURBULENCE TRANSDUCER,
Geological Survey, Fort Collins, Colo.
Erich J. Plate, and James P. Bennett.
ASCE Proceedings, Journal Engineering Mechanics Division, Vol 95, No EM6, Paper 6955, p 1307-1329, Dec 1969. 23 p, 10 fig, 13 ref, append.

Descriptors: *Flowmeters, *Turbulence, Instrumentation, Calibrations, Turbulent flow, Mathematical studies, Flow measurement, Gages, Stream gages.
Identifiers: Turbulence meters, Turbulence transducers.

Two factors prevent the direct determination of the point spectrum of axial turbulence from a spectrum of the fluctuations in rpm values of the analog output of a rotary flow meter. The first of these is the effect of the finite size of the flow meter propeller, the second is the effect of its inertia. The finite size effect depends on the local turbulence structure and is characterized by an 'efficiency factor' which in general can only be estimated. The effect of propeller inertia can be evaluated by linearizing the equation of motion of the propeller. From the resulting linear ordinary differential equation with constant coefficients, a transfer function for the linear system can be calculated. This transfer function makes it possible to calculate a spectrum of axial turbulence in which the velocity is averaged over the area of the propeller. Experiments in which propellers were oscillated sinusoidally while being towed through still water showed that the amplitude response function is approximately equal to that of a first-order system, while the phase function appeared to be independent of the natural frequency of the system. (Knapp-USGS)
W70-04308

DESCRIPTION OF A FREELY DROPPED INSTRUMENT FOR MEASURING CURRENT VELOCITY,
Nova Univ., Fort Lauderdale, Fla. Physical Oceanographic Lab.
William S. Richardson, Allan R. Carr, and Henry J. White.
Supported by Office of Naval Research. Journal of Marine Research, Vol 27, No 1, p 153-157, Jan 15, 1969. 5 p, 2 fig, 2 ref.

Descriptors: *Current meters, *Oceanography, *Currents (Water), *Ocean currents, Instrumentation, Flow measurement, Velocity, Drift bottles, Drifting (Aquatic).
Identifiers: Ocean current measurement.

A new form of freely dropped instrument for current-velocity measurements is described. Operational procedures for using the instrument and its auxiliary equipment are given. The instrument is dropped, a fix is taken, and the clock begins to count when the radio signal is lost as the transmitting antenna goes under water. When the instrument returns to the surface, the transmitter comes back on the air. The receiver hears this signal and turns off the clock, which then displays the run time. Since several simultaneous drops to different depths are often made and since each drop requires a back extrapolation from fix position to surfacing position, using the surface drift, a float is used to measure the surface current after the last instrument is dropped. The float has nearly the same dimensions as the instrument, but it is made to float like the instrument on the surface. (Knapp-USGS)

RESPONSE OF GAS-PURGED MANOMETERS TO WATER-LEVEL SURGES,
Geological Survey, Menlo Park, Calif.
J. R. Beck, and C. R. Goodwin.
Available from Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $3.75 per copy. Geological Survey Research 1969, Professional Paper 650-D, p D274-D277, 1969. 4 p, 3 fig.

Descriptors: *Water level fluctuations, *Steam gages, *Calibrations, *Manometers, Instrumentation, Water levels, Equipment, Laboratory tests, Waves (Water).
Identifiers: Gas-purged manometers, Bubble gages.

Tests were conducted to evaluate the performance of bubble-gage servocontrolled manometers when operating in a lake or stream whose water level is oscillating at amplitudes and frequencies that are likely to be found at medium or high stages in streams or in larger bodies of water subject to wind action. Results of the tests indicate that gas-purged manometers produce an accurate record of water stage under static conditions but indicate a stage value less than the mean of the surge when surface waves of significant amplitudes and frequencies are present. FLOOD OF AUGUST 1969, RICHMOND QUADRANGLE, RICHMOND, VIRGINIA,
Geological Survey, Washington, D.C.
E. M. Miller.
Available from U S Geological Survey, Washington, DC, 20240, for $0.75 per copy. Geological Survey Hydrologic Investigations Atlas HA-410, 1 sheet, 1969. Text, 2 fig, 2 photo, 1 map, 1 tab.

Descriptors: *Floods, *Virginia, *Hurricanes, *Historic flood, Cloudbursts, Peak discharge, Rain, Rain water, River flow, Storm runoff, Stage-discharge relations.
Identifiers: James River (Va), Richmond (Va).

The approximate areas inundated in and near Richmond, Va., by the flood of August 22, 1969, on the James River are shown on a topographic map. The flood was caused by torrential rains brought by the remnants of Hurricane Camille. The flood of May 1771 is considered the greatest in the James River basin since the settlement of Jamestown in 1607. The August 1969 flood at the Virginia Division of Water Resources gaging station, 0.1 mile upstream from the Huguenot Memorial Bridge (river mile 111.7), reached a stage of 24.95 feet, gage datum, (discharge, 222,000-cfs) and was the highest for the period of record (1935-69). At the U.S. Weather Bureau gaging station at river mile 103.7, the flood reached a stage of 28.6 feet, msl, (29.9 ft at former site of U.S. Weather Bureau gaging station at river mile 104.6), and was the highest since the great flood of 1771. (Knapp-USGS)

FLOOD OF AUGUST 1969 ON MAURY RIVER AT BUENA VISTA, VIRGINIA,
Geological Survey, Washington, D.C.
Gerald S. Runner.
Available from U S Geological Survey, Washington, DC, 20240, for $0.50 per copy. Geological Survey Hydrologic Investigations Atlas HA-412, 1 sheet, 1969. Text, 2 fig, 3 photo.

Descriptors: *Floods, *Virginia, *Hurricanes, *Historic flood, Cloudbursts, Peak discharge, Rain, Rain water, River flow, Storm runoff, Stage-discharge relations.
Identifiers: Maury River (Va), Buena Vista (Va).

The approximate area inundated by the Maury River at Buena Vista, Va., during the flood of August 20, 1969, is shown on a photomosaic base map and photographs. The flood, the highest known on the river, was caused by the torrential rains brought by the remnants of Hurricane Camille. Floodmarks were identified in a 4-mile reach of the river near Buena Vista, and their elevations were determined by leveling to bench marks. Flood boundaries were delineated on aerial photographs taken after the crest and were verified by field inspection. The flood of August 20, 1969, reached an elevation of 852.0 ft above mean sea level (msl) at U.S. Highway 60 at Buena Vista and was the highest since records began in 1936 and probably the highest since 1870. The previous maximum of record was 845.8 ft, msl, at the same site during the flood of March 17-19, 1936. Stage-frequency relations were derived from stage records for the U.S. Weather Bureau gage at U.S. Highway 60 at Buena Vista for the period 1936-69. Profiles of the water surface constructed from high-water marks left by the flood are given. (Knapp-USGS)
W70-04349

FLOOD OF AUGUST 1969, DREWRYS BLUFF QUADRANGLE, RICHMOND, VIRGINIA,
Geological Survey, Washington, D.C.
E. M. Miller.
Available from US Geological Survey, Washington, DC, 20240, for $0.75 per copy. Geological Survey Hydrologic Investigations Atlas HA-411, 1 sheet, 1969. Text, 2 fig, 1 photo, 1 map, 1 tab.

Descriptors: *Floods, *Virginia, *Hurricanes, *Historic flood, Cloudbursts, Peak discharge, Rain, Rain water, River flow, Storm runoff, Stage-discharge relations.
Identifiers: James River (Va), Richmond (Va), Flood frequencies.

The approximate areas inundated in and near Richmond, Va., by the flood of August 22, 1969, on the James River are shown on a topographic map. The flood was caused by torrential rains brought by the remnants of Hurricane Camille. The flood of May 1771 is considered the greatest in the James River basin since the settlement of Jamestown in 1607. The August 1969 flood at the Virginia Division of Water Resources gaging station, 0.1 mile upstream from the Huguenot Memorial Bridge (river mile 111.7), reached a stage of 24.95 feet, gage datum, (discharge, 222,000 cfs) and was the highest for the period of record (1935-69). At the U.S. Weather Bureau gaging station at river mile 103.7, the flood reached a stage of 28.6 feet, msl, (29.9 ft at former site of U.S. Weather Bureau gaging station at river mile 104.6), and was the highest since the great flood of 1771. The relationship between recurrence interval and elevation above mean sea level at the gaging station on the James River near Richmond (river mile 111.7) is shown graphically. (Knapp-USGS)

Department of Water and Sewers, Chicago, Ill.
T. S. Ford, and James Moorman.
Chicago, City of Chicago Department of Water and Sewers, 1956. 22 p, 1 fig, 44 photos.

Descriptors: *Sewers, *Drainage systems, *Sewage, *Storm drains, *Closed conduits, *Channels, *History, Public health, Drainage water, Pipes, Construction, Tunneling, Canals construction, Waste water treatment, Pumping plants, Diseases.
Identifiers: *Chicago, *Chicago Department of Water and Sewers, *Chicago Sanitary District, Interceptor sewers, Sewer construction, Sewer history, Chicago sewer system.

This historical work summarizes the first 100 years of Chicago's city sewer system. A plan for a sewer system was adopted by the Board of Sewerage Commissioners in 1855. The sewers were designed to discharge into Lake Michigan and the Chicago

River. The 'combined' sewers were to be constructed of brick masonry and tile pipe. During 1856, sewers in the present 'Loop' district were built. By 1861, the system included 54 miles of sewers with 2,400 house connections. By 1886, the Chicago River had become a putrid septic tank from sewage discharges, and epidemics were prevalent. The state legislature passed an enabling act and, in 1889, the Sanitary District of Chicago was formed to dig a canal to flush Chicago's sewage to the Mississippi River, via the Fox and Illinois Rivers. The Sanitary and Ship Canal, was completed in 1900. In 1910, the North Shore Channel was completed, and intercepting sewers and two pumping stations were built near the Lake. The Calumet Sag Canal was completed in 1923. Sewage treatment plant construction was begun in 1922. By 1956, Chicago's sewer system included in 3,600 miles of sewers with 450,000 connections, 132,000 manholes and 190,000 catch basins. Its replacement cost was valued at $500 million. STABILIZATION OF ALLUVIAL CHANNELS,
Colorado State Univ., Fort Collins. Natural Resources Center.
N. G. Bhowmik, and D. B. Simons.
Available from the Clearinghouse as PB-189 768, $3.00 in paper copy, $0.65 in microfiche. Colorado State Univ, Natural Resources Center, Partial Completion Report, June 30, 1969. 50 p. OWRR Project A-002-COLO.

Descriptors: *Channel stabilization, *Design hydraulic, Alluvial, Bends, Boundary shear, Mechanics, Riprap, Stability, Waves.

Flow dynamics and the effects of turbulent fluctuations of velocity, drag forces, lift forces, waves and secondary circulations on the stability of riprap particles forming the perimeter of stable alluvial channels were studied. A field study was made of three channels successfully stabilized with gravel riprap. Additional available existing data on initiation of motion and on stable channels formed in coarse materials were gathered and analyzed to explain the flow dynamics and to outline a design procedure for canal stabilization. Necessary relationships were developed to facilitate the design of stable channels formed in coarse alluvial materials. A design procedure valid for both the straight reaches and the bends to stabilize alluvial channels is presented.

BOUNDARY EFFECTS ON JET FLOW PATTERNS RELATED TO WATER QUALITY AND POLLUTION PROBLEMS,
Illinois Univ., Urbana. Dept. of Civil Engineering.
W. Hall C. Maxwell, and Hormoz Pazwash.
Available from the Clearinghouse as PB-189 787, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Illinois Water Resources Center, Research Report No 28, Jan 1970. 84 p, 3 tab, 28 fig, 20 ref. OWRR Project B-017-ILL.

Descriptors: *Boundaries (Surfaces), *Diffusion, Flow characteristics, *Flow profiles, *Free surfaces, Hydraulics, *Jets, Temperature, Tracers.
Identifiers: Fluid flow, Free turbulence, Heat flux, Mass flux, Momentum flux, Similarities.

An experimental and analytical study of the modification of jet flow patterns by a nearby free surface and nearby horizontal or gently downward sloping plane bed is described. The patterns were found to be radically different from those for a deeply submerged jet. Both the free surface and bed tend to attract the jet and both cause spreading of the flow in their proximity. One boundary generally proves to be dominant, depending upon the geometrical parameters. The analytic study used Reichardt's hypothesis and its generalization for momentum, mass and heat flux by Alexander, Baron and Comings. The techniques are first applied to predict the effect of finite nozzle size on deeply submerged jet flows. Then the effect of the free surface on a shallow submerged jet is studied. A strong influence by a small initial upward deflection of the jet is indicated. A preliminary suggestion is made for a mathematical model to represent a shallow submerged jet in a shallow reservoir. The results may be applied in the study or design of discharge outlets, syphon spillways, hydraulic breakwaters and diffusion of tracers in streams. The diffusion of momentum, mass or heat may be studied using the analytic techniques.

THE MECHANICS OF A DROP AFTER STRIKING A STAGNANT WATER LAYER,
Illinois Univ., Urbana. Dept. of Civil Engineering.
Harry G. Wenzel, Jr., and Raymond C. T. Wang.
Available from the Clearinghouse as PB-189 790, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Illinois Water Resources Center, Research Report No 30, Jan 1970. 130 p, 3 tab, 4 fig, 147 ref, 4 append. OWRR Project B-018-ILL.

Descriptors: *Impact (Rainfall), *Numerical analysis, *Raindrops, Shear stress, *Sheet flow, Soil erosion, Resistance.

A first step is represented in the theoretical analysis of sheet flow with rainfall impinging on the free surface. This is a common occurrance in urban areas and many design procedures do not recognize the added resistance due to the rainfall. The analytical approach consists of the numerical solution of the Navier-Stokes equations, including surface tension as a boundary condition, using a Synthetic-Cell-Fluid scheme which rigorously conserves mass and momentum. The results include a maximum impact pressure model and a quantitative discussion of pressure distribution, boundary shear, the effect of surface tension, the free surface configuration, and the various forms of energy and its transformation during the impact process. Experiments were performed consisting of drop impact pressure measurements using various drop sizes, impact velocities and water layer depths. These data were used to successfully verify the theoretical work.

MODEL AND PROTOTYPE TESTS OF BUOYANT SPILLWAY GATES,
Pacific Gas and Electric Co., San Francisco, Calif.
Arthur G. Strassburger, and James F. Sias.
Proc Amer Soc Civ Eng, J Power Div, Vol 95, No PO2, p 335-349, Oct 1969. 15 p, 17 fig.

Descriptors: *Radial gates, *Spillway gates, Hydraulic gates, Models, *Model tests, *Prototype tests, Earth dams, Buoyancy, Floods, Floats, Hydraulic models, Water levels, Safety, Reservoir operation, Leakage, Design criteria Spillways, Gate control, Gate seals, Gate seats.
Identifiers: *Test results, McCloud Dam (Calif).

Design of a radial gate, modified to obtain an opening torque, and having an additional upstream projection to obtain buoyancy for fail-safe operation, is presented. Operating requirements for a full reservoir during winter storm periods precluded an uncontrolled spillway or gates held open. An earth and rockfill dam, on the contrary, required fail-safe spillway control. A difficult site added to the design and cost problems. The gate as designed can open to pass in excess of the record flood without external power source or without float wells, tripping devices, counterweights, or other accessories. Model tests were conducted for determining downpull effects of flow under a gate and through adjacent gates. Prototype tests under operating conditions were conducted; results are compared with model test results. Adjustable side plates replace conventional seals to eliminate seal friction and keep leakage to a tolerable limit.

MECHANICS OF FLOW IN OPEN CHANNEL SYSTEMS,
California Univ., Davis. Dept. of Water Science and Engineering.
J. Amorocho, and Alan Babb.
Available from the Clearinghouse as PB-189 954, $3.00 in paper copy, $0.65 in microfiche. California University Water Science and Engineering Paper No 1040, Nov 1969. 10 p, 7 ref. OWRR Grant No B-037-CAL. Grant W113 Univ of Calif.

Descriptors: *Open channel flow, *Hydraulics, *Junctions, *Radial gates, Hydraulic transients, Roughness (Hydraulic), Hydraulic similitude, Model studies, Hydraulic models, Channel morphology, Hydraulic structures, Gates.
Identifiers: Channel transitions, Hydraulic transitions.

Flow phenomena in channel transitions and flow in the neighborhood of open channel gates and controls were studied in laboratory channels. Data were obtained on the variation of the energy losses for warped expansions at high Reynolds' numbers and criteria were established for corrections of incomplete similitude in model investigations of these configurations. Detailed analyses of the fluid mechanics of expansions were advanced with the study of conical shapes. These investigations involved the development of special laboratory techniques and the evaluation of the terms of the integrated equations of energy and momentum balance for the flow in the expanding fields. The analysis of the results will lead to analytic methods for optimum transition design. The behavior of radial gates under a large variety of flow conditions was investigated with particular reference to multigated structures. (Knapp-USGS)

SIMILAR SOLUTIONS OF TURBULENT BOUNDARY LAYER HEAT AND MASS TRANSFER PROBLEMS,
Rensselaer Polytechnic Inst., Troy, N.Y. Dept. of Chemical Engineering.
L. F. Donovan, O. T. Hanna, and S. Yerazunis.
Chemical Engineering Science, 1967, Vol. 22, p. 595-610, Pergamon Press.

Descriptors: *Heat, *Heat transfer, *Temperature, Mass transfer, *Turbulent boundary layers, Momentum equation, Turbulence, Thermodynamic behavior, Heat Balance, Shear, Viscosity, Eddies.

It is shown that similar solutions of certain turbulent boundary layer heat and mass transfer problems can be obtained when the thermal and diffusion layers lie within the constant shear layer, as is the case when Prandtl and Schmidt numbers are large. Closed form solutions are obtained for the problems of heat transfer from an isothermal surface, mass transfer with a finite interfacial velocity, and heat transfer from a surface having a particular temperature distribution. A comparison of experimental duct heat transfer data with Spalding function calculated with each of Spalding's laws of the wall shows that one of the laws is significantly superior to the other. TRANSPIRATIONAL HEAT TRANSFER FROM A CYLINDER IN CROSS FLOW INCLUDING THE EFFECTS OF TURBULENT INTENSITY,
Oregon State Univ., Corvallis.
Eugene Elzy, and C. E. Wicks.
Heat transfer-Seattle, Chemical Engineering Progress, Symposium series, Vol. 64, No. 82, 1968, p 150-165.

Descriptors: *Heat transfer, *Reynolds number, *Turbulent flow, Cooling, Mass transfer, Momentum transfer, Boundary layer, Transpiration, Laminar flow, Air, Heat exchangers, Friction, Winds.
Identifiers: *Heat transfer coefficient, Wind tunnel, Air injection.

The local heat transfer coefficient is measured in the laminar and separated regions of a cylinder in cross-flow mounted in a subsonic wind tunnel. Experiments are conducted by uniformly injecting hot air from the porous cylindrical surface. The effects of Reynolds number and turbulent intensity of the mainstream air is studied at various injection rates. The local heat transfer coefficient is decreased by injection in all regions around the cylinder at both low and high turbulent intensities. The experimental results for low turbulence are compared with theoretical predictions by the Eckert and Merk similar methods for the laminar region, and good agreement is obtained. (Novotny-Vanderbilt)

FORCE ON A SMALL SPHERICAL EVAPORATING PARTICLE IN ITS PURE VAPOUR DUE TO MOTION AND TEMPERATURE GRADIENTS,
Central Electricity Generating Board, Leatherhead (England). Central Electricity Research Labs.
G. C. Gardner.
Chemical Engineering Science, Vol. 23, p. 29-40, 1968. 2 fig., 16 ref.

Descriptors: *Evaporation, *Energy transfer, Viscosity, Stress, Temperature, *Velocity, *Temperature distribution, Reynolds number, Equilibrium, Latent heat, Vapor pressure.
Identifiers: *Slip.

Analyses are made for the free molecular regime, where the particle is small compared to the mean free path of vapor molecules, and for the viscous continuum-slip regime, where the particle is large compared to the mean free path. Energy exchange between the vapor and the particle is considered in the free molecular regime as well as the momentum exchange, which has previously been considered for inert, non-evaporating particles. Thus, it is shown that conduction of heat within the particle can have a small importance for the larger particles that are included within the regime. Otherwise the equations for the force on a particle reduce to particular forms of those already derived for inert particles. The equations for the continuum regime, without slip, show that the particle has an equilibrium velocity equal to the velocity that the continuum would attain, if the heat being conducted far from the particle, due to the temperature gradient, was used to evaporate more vapor and thus create a vapor flow. When, however, the particle size becomes small enough for slip to be important, the equilibrium velocity rises above this value. (Novotny-Vanderbilt)
W70-04480

SURFACE RESISTANCE IN TRANSPORT FROM VAPOR TO LIQUID,
Lehigh Univ., Bethlehem, Pa. Whitaker Lab.
Robert W. Coughlin.
Chemical Engineering Science, Vol. 22, p. 1503-1511, 1967. 3 fig., 19 ref.

Descriptors: *Condensation, *Diffusion, Eddies, Jets, *Distribution, Mass transfer, Thermal conductivity, Thermodynamic behavior, Temperature.

The role of surface resistance in the formulation of the penetration theory of interphase transfer is examined for the cases of constant, uniform surface renewal rate and random surface renewal; using the distribution function proposed by Danckwerts, it is shown that both cases are almost equivalent. Some recent data obtained in experiments aimed at measuring the condensation coefficient of water are examined in light of penetration theory formulated with and without surface resistance. It is shown that the data suggest a transition from the conventional penetration theory (without surface resistance) to a regime where surface resistance becomes important and begins to control the transport rate. It is also pointed out that the data may suffer from fluid mechanical acceleration effects and that they also suggest a condensation coefficient which decreases with time. (Novotny-Vanderbilt)
W70-04485

EXACT SOLUTION TO ENTRY-REGION LAMINAR HEAT TRANSFER WITH AXIAL CONDUCTION AND THE BOUNDARY CONDITION OF THE THIRD KIND,
Brookhaven National Lab., Upton, N.Y.
Hsu Chia-Jung.
Chemical Engineering Science, Vol. 23, p. 457-468, 1968. 4 tabs, 7 figs, 6 refs.

Descriptors: *Heat transfer, *Laminar flow, Mass transfer, Temperature, Viscosity, Reynolds number, *Mathematical models, Energy, *Heat flow, Diffusion, Bulk density, Specific heat, Velocity.

A mathematical scheme is devised for obtaining the exact thermal-entry-region temperature solutions for laminar flow (Poiseuille's parabolic velocity profiles) heat transfer subject to significant axial conduction and the boundary condition of the third kind. It is demonstrated that the heat transfer problem which ignores the effect of axial conduction, in reality, corresponds to a part of the generalized problem in which such effect is taken into consideration. Irrespective of the significance of axial conduction, the temperature solution can be represented by a unique mathematical expression in which only the magnitude of the eigenvalues and the associated constants vary with Peclet number. As Peclet number approaches infinity, the generalized temperature solution reduces to that for the case of negligible axial conduction. Determination of the first twelve eigenvalues, eigenfunctions and the series expansion coefficients was made with the aid of high-speed digital computer, for Peclet numbers of 1, 5, 10, 20, 30, 50, 100 and infinity, and for convective parameter delta (%kr sub zero/k) of 2, 10 and 100. Examination of the thermal-entry-region temperature profiles and the local Nusselt numbers revealed that the effect of axial conduction is indeed significant if Peclet number is less than approx. 100. The results of the present analysis showed good qualitative agreements with those of Schneider, who analyzed a similar problem by assuming a slug-flow model. (Novotny-Vanderbilt)

THE STABILITY OF BLOCKS SUBJECTED TO PLUNGING WATER JETS,
Windsor Univ. (Ontario).
S. P. Chee, and P. V. Padiyar.
Water Resour Bull, Vol 5, No 3, p 57-62, Sept, 1969. 6 p, 3 fig, 8 ref.

Descriptors: *Energy dissipation, Flip buckets, *Spillways, *Scour, Baffles, *Riprap, River beds, Streambeds, Jets, *Stilling basins, Model tests, Hydraulic models, Erosion, Hydraulics, Hydraulic structures, Foreign research.
Identifiers: *Energy dissipators, *Plunge basins, Foreign testing, *Armoring (Streambed), Ontario (Canada), Canada.

The energy of a jet of water from a spillway is commonly dissipated by using flip buckets to throw the jet a safe distance from the spillway. Model tests are often made to evaluate scouring in a homogeneous bed of granular material; the results always show a regular dish-shaped hole. The adverse performance of some prototype buckets has cast coubts on the wisdom of this design philosophy. Natural riverbeds are heterogeneous and develop very irregular steep-sided scour holes that may progress upstream and endanger the spillway. Secondary currents generated in the irregularly shaped scour hole break up and undermine the riverbed. Eliminating the secondary currents would protect the scour hole from further deterioration. This could be achieved by excavating a plunge pool and protecting the hole by armoring the bed with a layer of large boulders. Laboratory tests were made on the stability of cubical blocks subjected to plunging water jets. The blocks were placed in a plunge basin at the base of a flip bucket. A dimensionless equation was derived and a nomogram was drawn to facilitate the solution. The results can be applied in determining the size of stones required to armor a plunge basin or scour hole. WHAT ARE THE PROSPECTS FOR HV AND EHV UNDERGROUND TRANSMISSION SYSTEMS,
Sargent and Lundy, Chicago, Ill.
E. H. Finch.
Consult Eng, Vol 33, No 3, p 128-136, Sept 1969. 7 p, 5 tab, 3 ref.

Descriptors: *Transmission (Electrical), *Extra high voltage, Costs, Research and development, *Electric cables, *Underground, Technology, Transmission lines, Trenches, Comparative costs, Thermal properties, Dielectrics, Reliability, Failure (Power), Maintenance, Electrical equipment, Electrical design, Aesthetics, Economics, Electric insulation.
Identifiers: *High voltage, *Underground cables, Power losses, Federal Power Commission, Pipe-type cables, Dielectric properties, Outages.

A major technological breakthrough is necessary before ehv underground transmission systems can be justified economically. Although the cost differential is less for hv lines, the difference is still staggering compared to overhead lines. The solution may be to develop an entirely new type of underground system. Cost comparisons are given for underground versus overhead transmission systems for 138 kv and 345 kv. Technical problems presented in underground installations are discussed. Current research and details of several major research projects are reviewed. Placing ehv underground is discouraging from economic and technical factors inherent in today's designs, but the large volume of research is encouraging. A major breakthrough may be made because of the existing need.

ELECTRICAL STRESS IN OIL-FILLED AND SOLID-TYPE HIGH VOLTAGE DIRECT CURRENT CABLES UNDER THERMAL AND ELECTRICAL TRANSIENT CONDITIONS,
Sumitomo Electric Industries Ltd., Osaka (Japan).
K. Kojima, and K. Matsuura.

Direct Curr, Vol 1, No 2, p 55-72, Aug 1969. 18 p, 35 fig, 5 tab, 7 ref.

Descriptors: *Electric cables, *Direct current, Electrical studies, Stress, *Stress distribution, Electric insulation, *Transient stress, Electric potential, Resistivity, Temperature, Polarity, Instrumentation, Experimental data, Foreign research, Thermal stress, Time, Dielectrics, Electric currents, Electric fields.
Identifiers: *Oil-filled cables, Japan, *High voltage, Cable sheaths, Potential gradients, Temperature rise, Electric conductors, Test results.

Many complicated effects concerning the insulation design of paper-insulated, oil-filled and solid-type, high-voltage direct-current (hvdc) cables are clarified. The purpose is achieved by tests performed under different thermal and electrical transient conditions. Measuring potentials and stresses in the insulation in each case provided much information for the discussion on stress distributions in insulation at no-load conditions, at thermal transient conditions, and at rapid polarity reversal. In the cases of oil-filled cables, experimental results show fairly good agreement with theoretical distribution calculations, based on the characteristics of resistivity-temperature and stress observed on impregnated paper-insulated cables. The experimental arrangement for measuring potential distribution throughout the solid cable insulation is described. Results are given, and comparisons are made between measured values of potential distribution and theoretical values.

TOWER DESIGNS FOR AEP 765-KV PROJECT,
American Electric Power Service Corp., New York.
Richard A. Kravitz, and A. James Samuelson.
Proc Amer Soc Civ Eng, J Power Div, Vol 95, No PO2, p 305-319, Oct 1969. 15 p, 5 fig, 4 tab, 4 ref, 2 append.

Descriptors: *Structural design, Structural engineering, Transmission lines, *Transmission towers, *Extra high voltage, Spans, Loads (Forces), Winds, Guyed towers, Design, Overhead ground wire, Torsion, Foundations, Testing, Design criteria, Yield strength, Computer programs.
Identifiers: Tower height, *Test results, Allowable stress, Anchored footings, Comparative studies.

Designs of 765-kv transmission line towers used by the American Electric Power Co (AEP) are summarized. The weather loading conditions and line design criteria used in developing structure configuration and designs are described. Tower designers and engineers responsible for developing design specifications are alerted to the pitfalls of designing towers without considering all practical combinations (within a loading combination) of some minimum with maximum loads and unequal leg extension combinations in rough terrain. The AEP computer program for analyzing towers as 3-dimensional elastic structures is discussed and comparisons are made to hand (static) methods used for analyzing towers. Alternate types of foundations to be used are described, insofar as anchor movement affects structure capabilities.

STABILITY OF SLOPES WITH SEEPAGE,
Colorado State Univ., Fort Collins. Natural Resources Center.
C. D. Muir, and D. B. Simons.
Available from the Clearinghouse as PB-189 770, $3.00 in paper copy, $0.65 in michrofiche. Colorado State Univ, Natural Resources Center, Partial Completion Report, June 30, 1969. 30 p, 1 ref. OWRR Project A-002-COLO.

Descriptors: *Bank stability, *Slope stability, Seepage, Hydraulic design, Slip circle, Embankments.

The effect of steady seepage on slope stability was based on laboratory tests on embankments having slopes of 2 to 1, 3 to 1, 4 to 1, and 5 to 1, and including sections with gravel toe, coarse central layer, coarse layer parallel to the surface, fine cnetral layer, and alternating fine and coarse layers. Computed stability numbers gave an indication of the change in location of the failure zone, as well as giving the cohesion values required for slope stability for friction angles of 5, 10, and 20 degrees and for 0, 40, and 100 percent saturation above the phreatic surface. Graphic correlations in three variables are presented by plotting stability numbers and the pore pressure parameter, Ru sub ave. versus ratios of headwater and tailwater to embankment height. The possible contribution of tailwater to both surface and massive circular slope failures is clearly indicated. Also, an explanation of the shape of surface sloughing based on pore pressure distribution is presented.

OPTIMUM PRELOAD RATES FOR COMPRESSIBLE NORMALLY CONSOLIDATED SOILS,
Northwestern Univ., Evanston, Ill; and Howard Univ., Washington, D.C.
Raymond J. Krizek, Clarence H. C. James, and Jorj O. Osterberg.
Soils Found, Vol 9, No 3, p 58-81, Sept 1969. 24 p, 7 fig, 4 tab, 28 ref.

Descriptors: *Loading rate, Loading time, *Consolidation, Computer programs, Shear strength, Bibliographies, Bearing capacities, Numerical analysis, *Foundations, Soil engineering, Soil mechanics, Soil strength, Settlement (Structural), Theory, Soil properties, Pore pressure.
Identifiers: Optimum loading, *Compressible soils, *Compressible foundation, *Preloading.

The significance of shear strength increases on allowable preload rates for compressible, normally consolidated soils subjected to a flexible strip load is examined. On the basis of representative soil parameters and various assumed boundary conditions, a computer analysis was made to predict systematically rates and magnitudes of shear strength increases and associated settlements occurring as primary consolidation progresses, and to evaluate the bearing capacity of the soil in terms of the strength increases. With adequate drainage, weak soils may increase measurably in bearing capacity during consolidation in a time period compatible with many construction schedules. Inadequate drainage precludes any reasonable bearing capacity increase, except when the ratio of horizontal to vertical coefficient of consolidation is large. Consolidation settlement is governed by the magnitude and duration of the applied load, which is governed, in turn, by the rate of bearing capacity increase. Consolidation settlements can be accelerated to a worthwhile degree only when reasonable bearing capacity increases occur. Optimizing preload rate is of little benefit if initial soil strength is high. (USBR)
W70-04262

EFFECT OF WATER CONTENT ON THE SHEAR CHARACTERISTICS OF GRANULAR SOILS SUCH AS SHIRASU,
Kagoshima Univ. (Japan).
Motohisa Haruyama.
Soils Found, Vol 9, No 3, p 35-37, Sept 1969. 23 p, 18 fig, 3 photo, 1 tab, 22 ref.

Descriptors: *Moisture content, Effects, Shear strength, Granular materials, Shear tests, Characteristics, *Sands, Triaxial compression, *Triaxial shear, Cohesion, Internal friction, Void ratio, Stress-strain, Curves, Axial strain, Foreign research, *Soil mechanics, Bibliographies, Soil properties, Shear stress.
Identifiers: Water content, Triaxial tests, Drained tests, *Soil characteristics, Japan, Rowe equation.

The effect of water content on shearing characteristics of granular soils such as Shirasu (white volcanic sand) is examined by drained triaxial compression tests on compacted specimens having different water contents. Axial strain at failure and dilatancy decreases as the water content increases. Decrease in dilatancy causes decrease in critical void ratio. Parameters of shear strength vary with confining pressure; the frictional component is large at lower pressures and the cohesion component is large at higher pressures. Particle interlocking causes the failure envelopes to be curved and have a cohesion intercept. At relative densities above 70% and water contents below 10% the angle of shearing resistance does not vary with water content; at other densities and water contents, the angle of shearing resistance decreases as the water content increases. Apparent cohesion at all densities is highest at water contents of 10 to 20% and decreases considerably at water contents above 10 to 20%. Decrease in shear strength with increase in water content is caused by a decrease in the portion of strength contributed by particle interlocking.
W70-04263

MIXING-IN-PLACE SOIL AND PORTLAND CEMENT.

Proc Amer Soc Civ Eng, Soil Mech Found Div, Vol 95, No SM6, p 1357-1363, Nov 1969. 7 p, 12 ref, append.

Descriptors: Construction costs, Cement grouts, *Foundations, Portland cements, *Soil cement, *Soil stabilization, Underground structures, Soil mechanics, Costs, Piles (Foundations), Mixing.
Identifiers: Construction methods.

Practical methods can be developed for mixing natural soils in place with cement grout to obtain reasonably uniform and strong soil-cement concrete to depths of 50 to 75 ft at rates of 50 to 100 cu yd/hr and at a cost of about $10/cu yd. Mixing-in-place methods will have widespread application, particularly for constructing underground walls and masses of soil-cement concrete for structure foundations in earthquake regions. Uses of plastic soil-cement are discussed and methods of mixing soil and cement in place below the ground surface are summarized. (USBR)

SAND DENSIFICATION BY PILES AND VIBROFLOTATION,
Woodward-Clyde-Sherard and Associates, Oakland, Calif.; and Naval Facilities Engineering Command, San Bruno, Calif. Western Div.
Carl E. Basore, and Joseph D. Boitano.
Proc Amer Soc Civ Eng, J Soil Mech Found Div, Vol 95, No SM6, pp 1303-1323, Nov, 1969. 21 p, 22 fig, 1 tab, 7 ref, append.

Descriptors: Compaction tests, Compaction, Compaction equipment, Cohesionless soils, *Foundations, Field tests, Liquefaction, Sands, Penetration resistance, Penetration tests, Piles (Foundations), Soil engineering, Soil liquefaction, Soil mechanics, Test procedures, Loose soils, *Soil compaction.

Identifiers: Comparative studies, Construction methods, Procedures, *Vibroflotation, *Compaction piles, *Vibratory compaction.

The effectiveness of compaction piles and vibroflotation in densifying 30 ft of loose to medium-dense sandfill at Treasure Island, Calif, was evaluated by field tests. Compaction piles were formed by driving a 14-in.-dia steel pipe mandrel with a false bottom to the required depth, filling the pipe with sand, and then withdrawing the pipe to leave a sand column. Relative densities of the fill were measured before and after densification by standard penetration tests and with samples obtained using a piston sampler. Compaction piles and vibroflotation were effective in densigying the sandfill when proper spacing was used. Vibroflotation produced a more uniformly dense fill. Compaction piles were spaced closer together than vibroflot points to produce the same relative density. Limited cost data indicate that vibroflotation is more economical than compaction by piles. (USBR)

A FLEXIBLE PROGRAM FOR AUTOMATIC ANALYSIS OF STABILITY OF SLOPES,
Mozambique Univ., Lourenco Marques; and Laboratorio Nacional de Engenharia Civil, Lisbon (Portugal).
J. B. Martins, E. Maranha, and F. A. Melo.
Eng Geol, Vol 3, No 3, p 249-261, July, 1969. 13 p, 6 fig, 3 tab, 10 ref.

Descriptors: *Computer programs, *Slip-circle method, Soil mechanics, *Slope stability, Soil engineering, Soil strength, *Stability analysis, Safety factors, Pore pressure, Earth dams, Embankments, Equations, Flow diagrams, Fills, Earthworks, Soil stability, Foreign design practices.
Identifiers: Computer-aided design, Bishop method of slices, Piezometric surface, Portugal.

A computer program for stability analysis of slopes (land slopes, earth dams, embankments, and quay walls) by the Swedish slip-circle method is described. Safety factor equations and a flow chart are presented. Two factors of safety are computed, one according to the ratio of resisting to overturning moments, the other based on a reduction factor of the strength of the soil, bringing the soil mass to a limiting equilibrium. Pore pressures can be defined either by Skempton's pore pressure coefficient taken as characteristic of each soil or by a piezometric polygonal line. Limited only by the capacity of the computer, 14 different soils separated by polygonal lines having a maximum of 50 vortices can be included in the soil mass, and the material above the failure surface can be divided into a maximum of 100 slices. Results from stability analyses of 2 specific cases are given. (USBR)

ROCKBOLTING OF TUNNELS FOR STRUCTURAL SUPPORT, PART I --THEORETICAL ANALYSIS, PART II--DESIGN OF ROCKBOLT SYSTEMS,
California Univ., Berkeley; and Leeds, Hill and Jewett, Inc., San Francisco, Calif.
H. D. McNiven, and H. M. Ewoldsen.
Int J Rock Mech Mining Sci, Vol 6, No 5, p 465-497, Sept 1969. 32 p, 19 fig, 11 ref.

Descriptors: *Rock bolts, Rock mechanics, Rock properties, *Tunnels, Tunnel design, Compression, Displacements, Elastic theory, Numerical analysis, Slipping, Strain, Stress analysis, Stress distribution, Supports, Tension, Tensile stress, Theory, Tangential stress, *Theoretical analysis.
Identifiers: Rock pressures, *Tunnel supports, Compressive stress, Computer-aided design, Slip planes, Tectonic loads.

Theoretical analysis of stresses and preliminary rational design procedures for rock bolt systems in tunnels are presented for several idealized cases. Stress fields for a circular tunnel in a gravitating medium and the stress field created by a single rock bolt are developed. Computations are made to obtain typical stress fields and to demonstrate the influence of the historic state of stress on the stress field surrounding the tunnel. The tunnel is examined for tension, compression, and slip failures; designs of rock bolt systems to prevent failure are presented. (USBR)

SYSTEMATIC MAPPING OF FRACTURE MORPHOLOGY,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
R. J. Lutton.
Geol Soc Amer Bull, Vol 80, No 10, p 2061-2065, Oct 1969. 5 p, 4 fig, 8 ref.

Descriptors: *Fractures, *Fractures (Geology), Materials, Symbols, Rocks, Rock properties, Shear cracks, Tension, Cohesive soils, Cracks, *Morphology, Loads (Forces), Surfaces, Mapping, *Geologic mapping, *Geologic investigations, Brittle failures, Ductility, Fissures, Joints (Geology), Fissures (Geology), Cracking.
Identifiers: Fracture traces, Crack propagation, Rock breakage.

The morphological approach to the study of rock fractures has been neglected until recently, and still is not fully appreciated. This is caused partly by the general failure to recognize that similar features can be found on fractures over a great range of scales. The relatively simple and universal fracture morphology is shown in a great range of scales, material types, and loads. The characteristic fracture forms are incorporated into a system of mapping symbols that apply equally well for all nonshear fracture surfaces in a variety of materials. Fractures can be described graphically in this manner regardless of type of material and loading condition over a scale range of 7 or more orders of magnitude. Observations made at the submicroscopic, microscopic, megascopic, and perhaps larger scales could be interrelated in different fields of physical science. (USBR)

CONCRETE REPAIR PROBLEMS: CAUSES AND CURES.

Concr Constr, Vol 14, No 11, pp 409-427, Nov, 1969. 16 p, 19 photo, 2 tab, 25 ref.

Descriptors: Concrete construction, Concrete structures, *Concrete technology, *Concretes, *Repairing, *Maintenance, *Rehabilitation, Deterioration, Alkali-aggregate reaction, Cracking, Cavitation, Crazing, Dusting, Efflorescence, Scaling, Stains, Sealing compounds, Protective coatings, Bibliographies.
Identifiers: *Concrete deterioration, Concrete properties, Concrete pavements, Concrete products, Crack control, Spalling.

For good results in repairing concrete, the causes of the deterioration must be determined. Sometimes the cause is readily apparent, but more frequently a skilled specialist or laboratory examination may be required. Some common causes of deterioration include alkali-aggregate reaction, cavitation, cracking, crazing, dusting, efflorescence, pop-outs, sandstreaking, scaling, spalling, stains, and uneven color. Recommended repair techniques include acid etching, calking, coating, replacement of concrete, dry-packing, grinding, jacketing, slab-jacking, resurfacing, sandblasting, stitching, and stressing. Some basic information is given on selecting repair materials. A veritable arsenal of repair materials and techniques is available for dealing with every type of deterioration. Concrete structures have the unique distinction of rarely being beyond repair. (USBR)

ELASTOMER TECHNOLOGY,
Firestone Tire and Rubber Co., Akron, Ohio.
Fred C. Weissert
Ind Eng Chem, Vol 61, No 8, p 53-59, Aug 1969. 7 p, 116 ref.

Descriptors: *Elastomers, *Rubber, Molecular structure, Additives, Fillers, Elastic deformation, Elasticity (Mechanical), Bibliographies, Reviews, *Synthetic rubber, Polymers, Physical properties, Mechanical properties, Tires, Curing compounds, Sealing compounds, Adhesives, Materials engineering, *Chemical engineering, Research and development.
Identifiers: Polymerization, Viscoelasticity

Continued improvement in the performance of elastomer products requires further knowledge of the relationships between molecular structure and mechanical behavior of elastomeric compounds. During 1968, research investigations emphasized the macromolecular features such as molecular weight distribution, branching, and crosslinking. A second growing area of elastomer research is directed toward understanding the nature of the physical and chemical interaction between phases of polymer blends, and also between rubber and filler phases. The presence of 2 or more phases is generally essential in useful elastomeric products. Current developments in polymer elastomers and blends are discussed; recent research and development work on additive compounding ingredients is reviewed, including mechanical behavior of polymers and compounding ingredients, and testing for characterizing the variety of intended end use conditions.

ADHESIVES, 1969,
PPG Industries, Inc., Springdale, Pa.
C. Clement Anderson.
Ind Eng Chem, Vol 61, No 8, p 48-52, Aug 1969. 5 p, 5 fig, 8 tab, 41 ref.

Descriptors: *Adhesion, *Adhesives, Materials, Materials engineering, *Polymers, Interfaces, *Wettability, Wetting, Composite materials, Surface tension, Reviews, Bibliographies, *Bonding, Rubber, Elastomers, Epoxy resins, Curing.
Identifiers: Bonding agents, Bond strength, Polyurethane resins, Peeling, *Synthetic resins.

Progress in the development of synthetic polymer adhesives is reviewed, covering new bonding processes, pressure-sensitive adhesives, rubber-based adhesives, carboxylated adhesives, polyurethanes, new methods of analysis, and important aspects of adhesion such as wetting, contact angle, and other interfacial phenomena. An empirical relationship has been established between glass temperature and critical surface tension of a polymer. Studies on the wetting of surfaces by polymer melts show that the cosine of the contact angle attains its final value apparently according to second-order kinetics. The wettability and conformations of reactive polysiloxanes were investigated; a table gives the critical surface tensions. Studies of the interface in glass-epoxy composites showed that fracture occurred at the glass-resin interface when adhesion was poor, but deep within the resin matrix when adhesion was good; good adhesion was observed when a coupling agent capable of co-reacting with the epoxy resin and forming a covalent bond was used.

W70-04132

STAINLESS STEELS AND OTHER FERROUS ALLOYS,
Hercules, Inc., Wilmington, Del.
Hugh B. Fischer.
Ind Eng Chem, Vol 61, No 8, p 42-47, Aug 1969. 6 p, 192 ref.

Descriptors: *Steel, Steel plates, Steel pipes, *Stainless steel, Structural steel, Pressure vessels, *Welding, Specifications, Alloys, Manufacturing, Heat exchangers, Boilers, Materials, Reviews, Materials engineering, Bibliographies.
Identifiers: Steel tubing, Stress corrosion, *Alloy steels, Corrosion resistance, *Corrosion resistant alloys, Electron-beam welding.

Materials selection, corrosion resistance, new alloys, new manufacturing techniques, and welding are covered in a review on ferrous materials. The review will enable selecting materials and maintenance for satisfactory operation under corrosive conditions and under extreme temperature and pressure. Materials for heat exchangers, piping, boilers, and pressure vessels are included. References are given on corrosion resistance, specific corrosion data, and stress corrosion cracking. Developments of new alloys in the U.S. and elsewhere are reported, including an austenitic stainless steel resistant to stress corrosion cracking in sea water, new structural steels, and a series of new superplastic stainless steels. The present trend in welding is toward increased deposition rates and decreased heat output. Large-diameter pipelines have been routinely welded with a portable electron-beam welder.
W70-04133

PLASTICS CHEMISTRY AND ENGINEERING,
Houston Univ., Tex.
Raymond B. Seymour.
Ind Eng Chem, Vol 61, No 8, p 28-41, Aug 1969. 14 p, 1 tab, 712 ref.

Descriptors: *Plastics, *Polymers, *Materials engineering, *Chemical engineering, Industrial production, Building materials, Containers, Education, Reviews, Bibliographies, Structural members, Membranes, Sheeting, Composite materials, Foams, Plastic pipes, Synthetic fibers, Weathering, Aging (Physical), Durability.
Identifiers: Synthetic resins, Careers, Plastic foam, Corrosion resistance.

The annual growth rate of the synthetic polymer industry in the USA is almost 3 times the average for all other industries; the volume of polymer production is projected to exceed the volume of all other non-polymer materials by 1980. Uses for synthetic polymers are being found to replace conventional materials in packaging, building materials, automobiles, aircraft, and road paving. Developments in applications of plastics are reviewed for structural materials, containers and vessels, composite materials, sheets and film, foams, plastic pipe, and synthetic fibers. The weathering, durability, corrosion resistance, and flame resistance of polymers are discussed; characterization and testing are included. The phenomenal growth of the polymer industry may be retarded in the early 1970's because of the scarcity of polymer-oriented scientists and engineers. Education and career opportunities in polymer science and technology are discussed.
W70-04135

POLYMER COATINGS,
PPG Industries, Inc., Springdale, Pa.
N. H. Frick, H. L. Gerhart, and H. E. Gilbert.
Ind Eng Chem, Vol 61, No 8, p 60-75, Aug 1969. 16 p, 3 fig, 2 photo, 263 ref.

Descriptors: *Protective coatings, *Paints, *Polymers, Reviews, Test procedures, Bibliographies, Resins, Pigments, Formulation, Curing, Color, Characteristics, Physical properties, Weathering, Emulsions, Mildews, Materials engineering.
Identifiers: Polymerization, *Plastic coatings, Synthetic resins, Latex.

An annual review of developments in polymer coating technology is presented to indicate some new directions taken and to create an awareness of problems and solutions. The review is not a rote recitation of all the coatings literature published in the past years. Emphasis is given to the concepts having useful application and information of current concern on breakthrough research that gives greater insight. Not all segments of technological effort in polymer coatings are reported, and coverage of application technology is limited. Subjects discussed are formulation concepts, synthetic resins, high energy activation, performance and testing, characterization techniques, physical properties, weathering, pigments and color science, and mildew control.
W70-04137

OVERVOLTAGES APPEARING ON HVDC CABLES DUE TO CONVERTER OPERATION,
English Electric Co. Ltd., Stafford; and Allmanna Svenska Elektriska A.B., Ludvika.
J. D. Ainsworth, Arne Johanssen, and K. J. Ralls.
Direct Curr, Vol 1, No 2, p 83-88, Aug 1969. 6 p, 11 fig, 2 ref.

Descriptors: *Direct current, *Electric cables, Disturbances, Faults (Electrical), Converters (Electrical), Transmission (Electrical), Transients, Lightning, Transmission lines, *Conductors, Inverters, Rectifiers, Alternating current, Foreign research.
Identifiers: *Overvoltage, *High voltage, Switching surges, Induced voltage, Protection (Electrical), Lightning surges.

Overvoltages experienced in hvdc conductor systems are caused by: (1) malfunctioning of either valves, or valve firing, or control circuits; (2) faults occurring in the d-c system; (3) disturbances in the a-c system propagating through into the d-c system; (4) external sources, such as lightning striking d-c overhead lines; and (5) normal control operations such as blocking, deblocking, and starting transmission. The effects of these 5 types of disturbances are discussed, principally those caused by faults originating in the d-c converters and d-c lines, or from the a-c systems. The information given is for consideration of d-c cables only; numerical examples are for illustration because the actual values of overvoltages depend on the configuration of individual schemes.

PESTICIDE TOLERANCES OF SELECTED FRESHWATER INVERTEBRATES,
W70-04149 05C

REDUCTION OF ZOOPLANKTON STANDING STOCKS BY PREDACEOUS CYCLOPS BICUSPIDATUS THOMASI IN MARION LAKE, BRITISH COLUMBIA,
W70-04183 02H

COPPER
THE CALCULATION OF THE ACUTE TOXICITY OF MIXTURES OF POISONS TO RAINBOW TROUT,
W70-04156 05A

COPPER SULFATE
RESPONSE OF THE GLOBIFERCUS PEDICELLARIAE TO INORGANIC SALTS IN THREE REGULAR ECHINOIDS,
W70-04147 05C

BEHAVIOR AND REACTIONS OF COPPER SULFATE IN AN IRRIGATION CANAL,
W70-04315 05B

TREATMENT OF ALGAE AND WEEDS IN LAKES AT MADISON,
W70-04494 02H

CORES
COMPOSITION OF INTERSTITIAL WATERS OF MARINE SEDIMENTS
TEMPERATURE OF SQUEEZING EFFECT,
W70-04075 02K

DISTRIBUTION OF NITRATES AND OTHER WATER POLLUTANTS UNDER FIELDS AND CEREALS IN THE MIDDLE SOUTH PLATTE VALLEY OF COLORADO,
W70-04488 05B

A WATER CORE PLANKTON SAMPLER,
W70-04489 05A

CORROSION RESISTANT ALLOYS
STAINLESS STEELS AND OTHER FERROUS ALLOYS,
W70-04133 08G

COST ANALYSIS
COST AND PERFORMANCE ESTIMATES FOR TERTIARY WASTEWATER TREATING PROCESSES,
W70-04298 05D

COSTS
PHYSICAL, LEGAL AND ECONOMIC ASPECTS OF ASSESSMENT OF COSTS AMONG DRAINAGE DISTRICTS LEGAL PHASE,
W70-04047 06E

REGIONAL CONSTRUCTION REQUIREMENTS FOR WATER AND WASTEWATER FACILITIES.
W70-04168 05F

WATER UTILITY COST TRENDS,
W70-04524 03D

COST-BENEFIT ANALYSIS
THE OPPORTUNITY COST OF DISPLACED PRIVATE SPENDING AND THE SOCIAL DISCOUNT RATE,
W70-04516 06E

COST-CLASSIFICATION
NEW PRICE POLICIES FOR MUNICIPAL WATER SERVICE,
W70-04522 06C

COTTON
MOISTURE CONTENT OF COTTON LEAVES AND PETIOLES AS RELATED TO ENVIRONMENTAL MOISTURE STRESS,
W70-04407 02I

AN INDUSTRIAL WASTE GUIDE TO THE COTTON TEXTILE INDUSTRY.
W70-04541 05D

CRAYFISH
BIOLOGY OF THE CRAYFISH ORCONECTES CAUSEYI AND ITS USE FOR CONTROL OF AQUATIC WEEDS IN TROUT LAKES,
W70-04500 02H

CROP PRODUCTION
SPRINKLERS AND VEGETABLE CROP MECHANIZATION IN DESERT AREAS,
W70-04415 03F

CROP RESPONSE
EFFECTS OF IRRIGATION REGIMES ON GRAPEFRUIT PEEL AND PULP RELATIONSHIPS,
W70-04403 02I

ROW SPACING AND FERTILIZATION INFLUENCES ON FORAGE AND SEED YIELDS OF INTERMEDIATE WHEATGRASS, BOSSIAN WILDRYE, AND GREEN NEEDLEGRASS (N DRYLAND,
W70-04406 02I

AN UNUSUAL PHOTONASTISM INDUCED BY DROUGHT IN PHASEOLUS VULGARIS,
W70-04417 02I

SPRINKLER FERTILIZATION AND PLANT DAMAGE,
W70-04419 03F

CRUSTACEANS
ACUTE TOXICITIES OF INSECTICIDES TO MARINE DECAPOD CRUSTACEANS,
W70-04152 05C

ACUTE TOXICITY OF THE INSECTICIDE SEVIN AND ITS HYDROLYTIC PRODUCT 1-NAPHTHOL TO SOME MARINE ORGANISMS,
W70-04165 05C

COMPOSITION AND NUTRITIVE VALUE OF FECAL PELLETS OF A MARINE CRUSTACEAN,
W70-04448 05C

CRYSTAL GROWTH
DESALINATION BY FREEZING - AN INVESTIGATION OF ICE PRODUCTION FROM BRINE IN A CONTINUOUS CRYSTALLIZER,
W70-04346 03A

CULTURAL EUTROPHICATION
THE ECOLOGICAL DECLINE OF LAKE ERIE,
W70-04496 02H

CULTURES
STUDY OF BACTERIA ASSOCIATED WITH MARINE ALGAE IN CULTURE. I. PRELIMINARY DETERMINATION OF SPECIES (FRENCH),
W70-04260 02H

CURRENT METERS
DESCRIPTION OF A FREELY DROPPED INSTRUMENT FOR MEASURING CURRENT VELOCITY,
W70-04310 07B

CURRENTS(WATER)
DESCRIPTION OF A FREELY DROPPED INSTRUMENT FOR MEASURING CURRENT VELOCITY,
W70-04310 07B

CYANOPHAGES
DISTRIBUTION OF CYANOPHAGES IN NATURAL HABITATS,
W70-04377 05C

CYANOPHYTA
TOXICITY AND ENVIRONMENTAL REQUIREMENTS OF A STRAIN OF APHANIZOMENON FLOS-AQUAE (L) RALFS,
W70-04282 05C

EFFECT OF DESASPIDIN AND DCMU ON PHOTOKINESIS OF BLUE-GREEN ALGAE,
W70-04293 05G

CYCLES
ANNUAL CYCLE, SPECIES DIVERSITY AND SUCCESSION OF PHYTOPLANKTON IN LOWER SARONICOS BAY, AEGEAN SEA,
W70-04450 05C

DAMAGES
MILLER V PRAIRIE CANAL CO (ACCESS RIGHTS OF OWNER OF CANAL EASEMENTS).
W70-04362 06E

SPRINKLER FERTILIZATION AND PLANT DAMAGE,
W70-04419 03F

DAMS
WATERWAYS AND MILLDAMS.
W70-04220 06E

DESTROYING BRIDGES AND INJURING CANALS.
W70-04222 06E

ABANDONMENT OF ROADS FOR FLOODING.
W70-04482 06E

DARCY'S LAW
THE VALIDITY OF SOIL-WATER DIFFUSIVITY THEORY FOR HORIZONTAL WATER ABSORPTION,
W70-04048 02G

DATA COLLECTIONS
STATISTICAL SUMMARIES OF ILLINOIS STREAMFLOW DATA,
W70-04091 02E

MAGNITUDE AND FREQUENCY OF MISSOURI FLOODS,
W70-04114 02E

HYDROLOGICAL DOCUMENTATION FOR THE EXPLOITATION OF RESERVOIRS IN PERMEABLE SOLID ROCKS FOR THE PURPOSE OF ARTIFICIAL INFILTRATION,
W70-04118 03B

CHANNEL CAPACITY AND FLOOD CHARACTERISTICS FOR SELECTED REACHES OF FIR CREEK AND TRIBUTARIES, DOUGLAS COUNTY, OREGON,
W70-04311 02E

BASIC HYDROGEOLOGIC DATA, PINE RIDGE INDIAN RESERVATION, SOUTH DAKOTA,
W70-04314 02F

ACID MINE DRAINAGE IN APPALACHIA.
W70-04328 05G

DCMU
EFFECT OF DESASPIDIN AND DCMU ON PHOTOKINESIS OF BLUE-GREEN ALGAE,
W70-04293 05G

DEAD SEA BASIN
HYDROGEOLOGICAL INVESTIGATIONS IN THE WESTERN CATCHMENT OF THE RED SEA,
W70-04420 02F

DEBRIS CONTROL
WATER RESOURCES DEVELOPMENT BY THE U.S. ARMY CORPS OF ENGINEERS IN CALIFORNIA.
W70-04388 04A

DECISION MAKING
ALTERNATIVE APPROACHES TO THE PRODUCTION PROGRAMMING PROBLEM,
W70-04529 06A

DEEP-TUBE WELLS
SOLAR BATTERIES AND AGROECONOMY OF DEVELOPING NATIONS,
W70-04413 03F

DEEP-WELL PUMPING
KHARGA, FROM THE OASIS MAGNA TO THE NEW VALLEY (IN GERMAN),
W70-04412 03F

DEFORMATION
DEFORMATION OF DEVELOPING EMBRYOS OF SEA URCHINS WITH CHANGES IN THE IONIC ENVIRONMENT,
W70-04144 05C

DEGRADATION
PERSISTENCE OF CARBARYL IN THE MARINE ESTUARINE ENVIRONMENT.
CHEMICAL AND BIOLOGICAL STABILITY IN AQUARIUM SYSTEMS,
W70-04164 05C

DELAWARE RIVER BASIN COMMISSION
DELAWARE RIVER BASIN COMPACT.
W70-04081 06E

DELAWARE RIVER BASIN COMPACT (POWERS AND DUTIES OF THE COMMISSION).
W70-04134 06E

DELAWARE RIVER BASIN COMPACT
DELAWARE RIVER BASIN COMPACT.
W70-04081 06E

DELAWARE RIVER BASIN COMPACT (POWERS AND DUTIES OF THE COMMISSION).
W70-04134 06E

DELAWARE RIVER BASIN COMPACT (WATER SUPPLY, POLLUTION CONTROL, FLOOD PROTECTION).
W70-04359 06E

DELTAS
ROLE OF SALT WEDGE IN BAR-FINGER SAND AND DELTA DEVELOPMENT,
W70-04306 02J

DEMAND
THE DEMAND AND SUPPLY OF OUTDOOR RECREATION, AN ECONOMETRIC ANALYSIS,

ORESUND(SWEDEN)
INFLUENCE OF POLLUTION ON THE POTTOM FAUNA OF THE SOUND (ORESUND),
W70-04499 05C

ORGANIC ACIDS
LIBERATION OF ORGANIC ACIDS BY GREEN UNICELLULAR ALGAE,
W70-04195 05C

ORGANIC LOADING
MANAGING LIVESTOCK WASTES TO CONTROL POLLUTION,
W70-04271 05C

ORGANIC MATTER
THE UPTAKE OF ORGANIC SOLUTES IN LAKE WATER,
W70-04194 02H

INFLUENCE OF METHOD FOR REMOVAL OF SESTON ON THE DISSOLVED ORGANIC MATTER,
W70-04285 07B

BACTERIAL UPTAKE OF ORGANIC SUBSTRATE NEW METHODS OF STUDY AND APPLICATION TO EUTROPHICATION,
W70-04379 05C

PRACTICAL IMPLICATIONS OF WATER REPELLENCY OF SOILS,
W70-04395 02G

ORGANIC SOLUTES
COMPETITION BETWEEN PLANKTONIC BACTERIA AND ALGAE FOR ORGANIC SOLUTES,
W70-04284 02H

INFLUENCE OF METHOD FOR REMOVAL OF SESTON ON THE DISSOLVED ORGANIC MATTER,
W70-04285 07B

ORGANOMERCURIC COMPOUNDS
TOXICITY OF PESTICIDE INGREDIENTS TO SOME FRESH WATER ORGANISMS (JAPANESE),
W70-04153 05C

ORGANOPHOSPHOROUS PESTICIDES
PESTICIDE TOLERANCES OF SELECTED FRESHWATER INVERTEBRATES,
W70-04149 05C

TOXICITY OF PESTICIDE INGREDIENTS TO SOME FRESH WATER ORGANISMS (JAPANESE),
W70-04153 05C

PARATHION DEGRADATION IN LAKE SEDIMENTS,
W70-04303 05B

ORGANOSULFURIC FUNGICIDES
TOXICITY OF PESTICIDE INGREDIENTS TO SOME FRESH WATER ORGANISMS (JAPANESE),
W70-04153 05C

ORGANOTIN COMPOUNDS
TOXICITY OF PESTICIDE INGREDIENTS TO SOME FRESH WATER ORGANISMS (JAPANESE),
W70-04153 05C

ORSANCO
THE REBIRTH OF A RIVER,
W70-04436 05G

OVERFLOWS
DISSOLVED-AIR TREATMENT OF COMBINED SEWER OVERFLOWS, A DEMONSTRATION PROJECT OF A PROTOTYPE TREATMENT PLANT DESIGNED TO TREAT WASTES FOUND AT A COMBINED SEWER OVERFLOW.
W70-04063 05D

OVERVOLTAGE
OVERVOLTAGES APPEARING ON HVDC CABLES DUE TO CONVERTER OPERATION,
W70-04140 08G

OWNERSHIP OF BEDS
SOUTH VENICE CORP V CASPERSEN (OWNERSHIP OF BEDS).
W70-04233 06E

OXYGEN CONSUMPTION
OXYGEN CONSUMPTION OF ENDRIN-SUSCEPTIBLE AND ENDRIN-RESISTANT GAMBUSIA DURING SUBLETHAL AND ACUTE ENDRIN EXPOSURE,
W70-04146 05C

OXYGEN DEMAND
HEMATOLOGICAL ASPECTS OF THE THERMOACCLIMATORY PROCESS IN THE RAINBOW TROUT, SALMO GAIRDNERI,
W70-04470 05C

OXYGEN REQUIREMENTS
REDUCED OXYGEN TOLERANCE AND TOXICITY OF PETROLEUM PRODUCTS TO JUVENILE AMERICAN SHAD,
W70-04166 05C

OYSTER BEDS
DREDGING OR SCRAPING FOR OYSTERS.
W70-04224 06E

OYSTERS
DREDGING OR SCRAPING FOR OYSTERS.
W70-04224 06E

OYSTER REGULATIONS.
W70-04225 06E

FISH, OYSTERS, AND SHELL FISH.
W70-04226 06E

OZARKS(ARK-MO)
ZOOPLANKTON STANDING CROPS IN A NEW AND AN OLD OZARK RESERVOIR,
W70-04190 05C

PACIFIC OCEAN
NITRATE DISTRIBUTION IN THE SUBARCTIC NORTHEAST PACIFIC OCEAN,
W70-04188 02L

PAINTS
POLYMER COATINGS,
W70-04137 08G

PANAMA
FRESHWATER ECOLOGICAL STUDIES IN PANAMA AND COLUMBIA,
W70-04162 05B

PARACENTROTUS LIVIDUS
DEFORMATION OF DEVELOPING EMBRYOS OF SEA URCHINS WITH CHANGES IN THE IONIC ENVIRONMENT,
W70-04144 05C

PARAMETRIC HYDROLOGY
TRANSFORMATION OF DETERMINISTIC AND STOCHASTIC PROCESSES IN HYDROLOGY,
W70-04258 02A

PASTURE MANAGEMENT
PASTURE IMPROVEMENT IN THE DESERT ZONES OF UZBEKISTAN,
W70-04398 03F

PEDICELLARIAE
RESPONSE OF THE GLOBIFEROUS PEDICELLARIAE TO INORGANIC SALTS IN THREE REGULAR ECHINOIDS,
W70-04147 05C

PEEL/PULP RATIO
EFFECTS OF IRRIGATION REGIMES ON GRAPEFRUIT PEEL AND PULP RELATIONSHIPS,
W70-04403 02I

PENNSYLVANIA
DELAWARE RIVER BASIN COMPACT.
W70-04081 06E

DELAWARE RIVER BASIN COMPACT (POWERS AND DUTIES OF THE COMMISSION).
W70-04134 06E

DELAWARE RIVER BASIN COMPACT (WATER SUPPLY, POLLUTION CONTROL, FLOOD PROTECTION).
W70-04359 06E

DELAWARE RIVER BASIN COMPACT (WATERSHEDS, RECREATION, HYDROELECTRIC POWER, FINANCING, GENERAL PROVISIONS).
W70-04361 06E

PERCHED WATER
'ONE HUNDRED AND TWENTY-THREE FEET LONG' THE HORIZONTAL WELL AS A NEW METHOD OF RANGE WATER DEVELOPMENT,
W70-04396 04B

PERCOLATING WATER
GEORGIA WATER LAW (SUBTERRANEAN WATERS, PERCOLATING WATERS SUBTERRANEAN STREAMS, SPRINGS),
W70-04207 06E

PERFORMANCE
COST AND PERFORMANCE ESTIMATES FOR TERTIARY WASTEWATER TREATING PROCESSES,
W70-04298 05D

PERIODIC MEASUREMENTS
GROUNDWATER LEVELS IN NEW MEXICO, 1965, AND CHANGES IN WATER LEVELS, 1961-1965,
W70-04390 02F

PERIPHYTON
PERIPHYTON GROWTH ON ARTIFICIAL SUBSTRATES IN A RADIOACTIVELY CONTAMINATED LAKE,
W70-04371 05C

PERMEABILITY
RECHARGE AND WATER INJECTION IN UNDERGROUND AQUIFERS (IN FRENCH),
W70-04353 04E

PERMITS
NAVIGATION WATER TRANSPORTATION (BOAT REGISTRATION, COMMON CARRIERS).
W70-04327 06E

NAVIGATION WATER TRANSPORTATION (BOAT REGISTRATION AND REGULATION).
W70-04345 06E

NAVIGATION WATER TRANSPORTATION (BOAT REGISTRATION AND REGULATION, NAVIGATION).
W70-04389 06E

PERSISTENCE
PERSISTENCE OF CARBARYL IN THE MARINE ESTUARINE ENVIRONMENT. CHEMICAL AND BIOLOGICAL STABILITY IN AQUARIUM SYSTEMS,
W70-04164 05C

PESTICIDE TOXICITY
PESTICIDE TOLERANCES OF SELECTED FRESHWATER INVERTEBRATES,
W70-04149 05C

ACUTE TOXICITIES OF INSECTICIDES TO MARINE DECAPOD CRUSTACEANS,
W70-04152 05C

TOXICITY OF PESTICIDE INGREDIENTS TO SOME FRESH WATER ORGANISMS (JAPANESE),
W70-04153 05C

ACUTE TOXICITY OF THE INSECTICIDE SEVIN AND ITS HYDROLYTIC PRODUCT 1-NAPHTHOL TO SOME MARINE ORGANISMS,
W70-04165 05C

PESTICIDES
BEHAVIOR AND REACTIONS OF COPPER SULFATE IN AN IRRIGATION CANAL,
W70-04315 05B

PETIOLES
MOISTURE CONTENT OF COTTON LEAVES AND PETIOLES AS RELATED TO ENVIRONMENTAL MOISTURE STRESS,
W70-04407 02I

PETROLEUM PRODUCTS
REDUCED OXYGEN TOLERANCE AND TOXICITY OF PETROLEUM PRODUCTS TO JUVENILE AMERICAN SHAD,
W70-04166 05C

PHENOLS
THE CALCULATION OF THE ACUTE TOXICITY OF MIXTURES OF POISONS TO RAINBOW TROUT,
W70-04156 05A

PHOSPHATE LIBERATION
THE RATE OF LIBERATION OF PHOSPHATE IN SEA WATER BY THE BREAKDOWN OF PLANKTON ORGANISMS,
W70-04366 05C

PHOSPHATES
THE RATE OF LIBERATION OF PHOSPHATE IN SEA WATER BY THE BREAKDOWN OF PLANKTON ORGANISMS,
W70-04366 05C

BIODEGRADABILITY OF POTENTIAL ORGANIC SUBSTITUTES FOR PHOSPHATES,
W70-04373 05G

METHOD FOR THE REMOVAL OF SOLUBLE PHOSPHATES IN WASTE WATER TREATMENT,

W70-04541 06D

SLIP
FORCE ON A SMALL SPHERICAL EVAPORATING PARTICLE IN ITS PURE VAPOUR DUE TO MOTION AND TEMPERATURE GRADIENTS,
W70-04480 08E

SLIP-CIRCLE METHOD
A FLEXIBLE PROGRAM FOR AUTOMATIC ANALYSIS OF STABILITY OF SLOPES,
W70-04538 08D

SLOPE STABILITY
STABILITY OF SLOPES WITH SEEPAGE,
W70-04052 08D

A FLEXIBLE PROGRAM FOR AUTOMATIC ANALYSIS OF STABILITY OF SLOPES,
W70-04538 08D

SLUDGE DISPOSAL
AN INDUSTRIAL WASTE GUIDE TO THE COTTON TEXTILE INDUSTRY.
W70-04541 06D

SMALL WATERSHEDS
APPLICATION OF A COMPUTER MODEL TO A DESERT WATERSHED,
W70-04357 02A

SMITH VALLEY(NEV)
ECONOMIC ASPECTS OF CONJUNCTIVE USE OF WATER, SMITH VALLEY, NEVADA, USA,
W70-04363 04B

SNOW
THE ROLE OF STRESS CONCENTRATION IN SLAB AVALANCHE RELEASE,
W70-04198 02C

O-18/O-16 RATIOS IN SNOW AND ICE OF THE HUEMUL AND KASKAWULSH GLACIERS,
W70-04260 02K

SNOW FENCES
CONTROLLED ACCUMULATION OF BLOWING SNOW,
W70-04057 02C

SNOW MANAGEMENT
SNOW ACCUMULATION IN RELATION TO FOREST CANOPY,
W70-04056 02C

CONTROLLED ACCUMULATION OF BLOWING SNOW,
W70-04057 02C

SNOW PACK
SNOW ACCUMULATION IN RELATION TO FOREST CANOPY,
W70-04056 02C

SOAPS
AMINO ACID CHELATING AGENTS IN DETERGENT APPLICATIONS,
W70-04456 05G

SOCIAL ASPECTS
A WORLD GEOGRAPHY OF IRRIGATION,
W70-04404 03F

SOCIAL DISCOUNT RATE
THE OPPORTUNITY COST OF DISPLACED PRIVATE SPENDING AND THE SOCIAL DISCOUNT RATE,
W70-04516 06B

SOCIAL IMPACT
AGRARIAN STRUCTURE IN THE PIEDMONT CASES OF TARAPACA PROVINCE (IN SPANISH),
W70-04410 03F

SOCIAL TIME PREFERENCE
THE OPPORTUNITY COST OF DISPLACED PRIVATE SPENDING AND THE SOCIAL DISCOUNT RATE,
W70-04516 06B

SOCIAL VALUES
AMENITY RESOURCES FOR URBAN LIVING,
W70-04425 06B

SOCIOECONOMIC CHARACTERISTICS
THE DEMAND AND SUPPLY OF OUTDOOR RECREATION, AN ECONOMETRIC ANALYSIS,
W70-04511 06D

SODIUM
SODIUM HAZARD OF BICARBONATE IRRIGATION WATERS,
W70-04104 02K

SODIUM HAZARD

SODIUM HAZARD OF BICARBONATE IRRIGATION WATERS,
W70-04104 02K

SOIL ALGAE
NITROGEN-FIXING BLUE-GREEN ALGAE IN SWEDISH SOILS,
W70-04166 02K

SOIL CEMENT
MIXING-IN-PLACE SOIL AND PORTLAND CEMENT.
W70-04530 08D

SOIL CHARACTERISTICS
EFFECT OF WATER CONTENT ON THE SHEAR CHARACTERISTICS OF GRANULAR SOILS SUCH AS SHIRASU,
W70-04263 08D

SOIL CONSERVATION
SOIL CONSERVATION DISTRICTS.
W70-04221 04D

DRAINAGE AND SOIL CONSERVATION.
W70-04223 04D

SOIL DISPOSAL FIELDS
NUTRIENT REMOVAL FROM CANNERY WASTES BY SPRAY IRRIGATION OF GRASSLAND,
W70-04062 05D

SOIL EROSION
SOIL MOVEMENT IN AN ALPINE AREA,
W70-04059 02J

SOIL MECHANICS
EFFECT OF WATER CONTENT ON THE SHEAR CHARACTERISTICS OF GRANULAR SOILS SUCH AS SHIRASU,
W70-04263 08D

SOIL MOISTURE
SOIL MOISTURE - INSTRUMENTATION, MEASUREMENT AND GENERAL PRINCIPLES OF NETWORK DESIGN,
W70-04115 02G

APPLICATION OF THERMODYNAMICS TO SOIL MOISTURE,
W70-04117 02G

EFFECT OF THE PRECEEDING CROP AND AGRONOMIC PRACTICE ON SORGHUM (SORGHUM BICOLOR L. MOENCH) AND GROUNDNUTS (ARACHIS HYPOGAEA L.) IN THE CENTRAL SUDAN,
W70-04405 03F

MOISTURE CONTENT OF COTTON LEAVES AND PETIOLES AS RELATED TO ENVIRONMENTAL MOISTURE STRESS,
W70-04407 02I

MOISTURE BALANCE IN SOILS OF THE EDMONTON AREA,
W70-04422 02G

SOIL NON-WETTABILITY
PRACTICAL IMPLICATIONS OF WATER REPELLENCY OF SOILS,
W70-04395 02G

SOIL PHYSICAL PROPERTIES
A STUDY OF CERTAIN PHYSICAL PROPERTIES OF A VERTISOL IN THE GEZIRA AREA, REPUBLIC OF SUDAN,
W70-04421 02G

SOIL STABILIZATION
MIXING-IN-PLACE SOIL AND PORTLAND CEMENT.
W70-04530 08D

SOIL SURFACES
PRACTICAL IMPLICATIONS OF WATER REPELLENCY OF SOILS,
W70-04395 02G

SOIL TREATMENT SYSTEM
NUTRIENT REMOVAL FROM CANNERY WASTES BY SPRAY IRRIGATION OF GRASSLAND,
W70-04062 05D

SOIL TYPES
A STUDY OF CERTAIN PHYSICAL PROPERTIES OF A VERTISOL IN THE GEZIRA AREA, REPUBLIC OF SUDAN,
W70-04421 02G

MOISTURE BALANCE IN SOILS OF THE EDMONTON AREA,
W70-04422 02G

SOIL WATER
THE VALIDITY OF SOIL-WATER DIFFUSIVITY THEORY FOR HORIZONTAL WATER ABSORPTION,
W70-04048 02G

SOIL WATER MOVEMENT
THE VALIDITY OF SOIL-WATER DIFFUSIVITY THEORY FOR HORIZONTAL WATER ABSORPTION,
W70-04048 02G

AN EXPERIMENTAL STUDY OF THE UPTAKE OF WATER BY SOYBEAN ROOTS,
W70-04069 02D

THE INFLUENCE OF FREEZING AND THAWING ON SOIL MOISTURE,
W70-04112 02C

THE CONTINUITY BETWEEN GROUNDWATER FLOW SYSTEMS AND FLOW IN THE UNSATURATED ZONE,
W70-04113 02G

APPLICATION OF THERMODYNAMICS TO SOIL MOISTURE,
W70-04117 02G

SOIL WATER RETENTION CURVES
APPLICATION OF THERMODYNAMICS TO SOIL MOISTURE,
W70-04117 02G

SOIL-WATER-PLANT RELATIONSHIPS
AN EXPERIMENTAL STUDY OF THE UPTAKE OF WATER BY SOYBEAN ROOTS,
W70-04069 02D

MOISTURE CONTENT OF COTTON LEAVES AND PETIOLES AS RELATED TO ENVIRONMENTAL MOISTURE STRESS,
W70-04407 02I

SOLAR BATTERIES
SOLAR BATTERIES AND AGROECONOMY OF DEVELOPING NATIONS,
W70-04413 03F

SOLAR RADIATION
SOLAR BATTERIES AND AGROECONOMY OF DEVELOPING NATIONS,
W70-04413 03F

SOLONETZIC SOILS
SALT AND WATER MOVEMENT INTO SOLONETZIC SOILS,
W70-04400 02G

SOLVENTS
TOXICITY OF PESTICIDE INGREDIENTS TO SOME FRESH WATER ORGANISMS (JAPANESE),
W70-04153 05C

SONIC FISH TAGS
BEHAVIOR OF SONIC-TAGGED CHINOOK SALMON AND STEELHEAD TROUT MIGRATING PAST HANFORD THERMAL DISCHARGES,
W70-04161 05C

SONORAN DESERT
AN ECOLOGICAL SIGNIFICANCE OF SEASONAL LEAF VARIABILITY IN A DESERT SHRUB,
W70-04414 02I

SORGHUM
EFFECT OF THE PRECEEDING CROP AND AGRONOMIC PRACTICE ON SORGHUM (SORGHUM BICOLOR L. MOENCH) AND GROUNDNUTS (ARACHIS HYPOGAEA L.) IN THE CENTRAL SUDAN,
W70-04405 03F

SOUND
INFLUENCE OF POLLUTION ON THE BOTTOM FAUNA OF THE SOUND (ORESUND),
W70-04499 05C

SOURING WASTE
TREATMENT OF MIXTURES OF TEXTILE WASTE AND DOMESTIC SEWAGE,
W70-04243 05D

SOUTH AFRICA
SURFACE WATER RESOURCES OF SOUTH AFRICA,
W70-04334 02E

SOUTH DAKOTA
BASIC HYDROGEOLOGIC DATA, PINE RIDGE INDIAN RESERVATION, SOUTH DAKOTA,
W70-04314 02F

SOUTH FLORIDA WATERS
ECOLOGY AND CHARACTERIZATION OF YEASTS FROM AQUATIC REGIONS OF SOUTH FLORIDA,
W70-04367 05C

SPECIAL ASSESSMENTS
FINANCIAL MANAGEMENT OF A WATER UTILITY,
W70-04513 06C

SPECIFIC YIELD
ON THE STORAGE COEFFICIENT OF FREE SURFACE AQUIFERS, CONSIDERING THE FLOW IN THE UNSATURATED ZONE (FRENCH),
W70-04124 02G

SPILLWAY GATES
MODEL AND PROTOTYPE TESTS OF BUOYANT SPILLWAY GATES,
W70-04264 08B

SPILLWAYS
THE STABILITY OF BLOCKS SUBJECTED TO PLUNGING WATER JETS,
W70-04540 08B

SPRINGS
SOME CHARACTERISTICS OF RIVER AND SPRING RUNOFFS IN THE KARSTIC AREAS OF ESTONIA (RUSSIAN),
W70-04109 02E

SPRINKLER IRRIGATION
SPRINKLERS AND VEGETABLE CROP MECHANIZATION IN DESERT AREAS,
W70-04415 03F

SPRINKLER FERTILIZATION AND PLANT DAMAGE,
W70-04419 03F

SQUAWFISH
A CHEMICAL SELECTIVELY LETHAL TO SQUAWFISH (PTYCHOCHEILUS OREGONENSIS AND P. UMPQUAE),
W70-04145 05C

STABILITY ANALYSIS
A FLEXIBLE PROGRAM FOR AUTOMATIC ANALYSIS OF STABILITY OF SLOPES,
W70-04538 08D

STABLE ISOTOPES
ISOTOPIC COMPOSITION AND ORIGIN OF THE ATMOSPHERIC WATER VAPOR IN THE REGION OF LAKE LEMAN (IN FRENCH),

W70-04304 02K

EXTRACTION OF DISSOLVED CARBONATE SPECIES FROM NATURAL WATER FOR CARBON-ISOTOPE ANALYSIS,
W70-04342 02K

STAGE-DISCHARGE RELATIONS
CHANNEL CAPACITY AND FLOOD CHARACTERISTICS FOR SELECTED REACHES OF ELK CREEK AND TRIBUTARIES, DOUGLAS COUNTY, OREGON,
W70-04311 02E

STAINLESS STEEL
STAINLESS STEELS AND OTHER FERROUS ALLOYS,
W70-04133 08G

STANDARD METROPOLITAN STATISTICAL AREAS
METROPOLITAN AREA DEFINITION A RE-EVALUATION OF CONCEPT AND STATISTICAL PRACTICE,
W70-04171 06E

STANDARDS
WATER, WASTE WATER, AND HEAT IN INDUSTRY (IN GERMAN).
W70-04218 05D

TREATMENT OF INDUSTRIAL WASTES IN THE UNITED STATES,
W70-04244 05D

THE REBIRTH OF A RIVER,
W70-04436 05G

STANDING CROP
REDUCTION OF ZOOPLANKTON STANDING STOCKS BY PREDACEOUS CYCLOPS BICUSPIDATUS THOMASI IN MARION LAKE, BRITISH COLUMBIA,
W70-04183 02H

ZOOPLANKTON STANDING CROPS IN A NEW AND AN OLD OZARK RESERVOIR,
W70-04190 05C

STATE ACCOUNTS
PUBLIC ECONOMICS,
W70-04514 06C

STATE BUDGET
PUBLIC ECONOMICS,
W70-04514 06C

STATISTICAL METHODS
NEW METHODS OF PROBABILITY CALCULATIONS FOR DISCHARGES AND NON-SCOURING VELOCITIES IN RIVERS' CROSS-SECTIONS,
W70-04255 02J

STATISTICAL MODELS
SIMULATION OF DAILY STREAMFLOW,
W70-04130 02E

A CASE FOR THE SIMULTANEOUS APPLICATION OF DETERMINISTIC AND STOCHASTIC METHODS IN HYDROLOGY,
W70-04259 04A

STATISTICS
MAGNITUDE AND FREQUENCY OF MISSOURI FLOODS,
W70-04114 02E

COMPUTATION OF ZELLNER-THEIL'S THREE STAGE LEAST SQUARES ESTIMATES,
W70-04523 06A

STEAM GAGES
RESPONSE OF GAS-PURGED MANOMETERS TO WATER-LEVEL SURGES,
W70-04337 07B

STEEL
STAINLESS STEELS AND OTHER FERROUS ALLOYS,
W70-04133 08G

STEELHEAD TROUT
BEHAVIOR OF SONIC-TAGGED CHINOOK SALMON AND STEELHEAD TROUT MIGRATING PAST HANFORD THERMAL DISCHARGES,
W70-04161 05C

STEPLIKE TIME PATHS
A THRESHOLD REGRESSION MODEL,
W70-04521 06A

STILLING BASINS
THE STABILITY OF BLOCKS SUBJECTED TO PLUNGING WATER JETS,
W70-04540 08E

STOCHASTIC HYDROLOGY
TRANSFORMATION OF DETERMINISTIC AND STOCHASTIC PROCESSES IN HYDROLOGY,
W70-04258 02A

STOCHASTIC PROCESSES
SIMULATION OF DAILY STREAMFLOW,
W70-04130 02E

TRANSFORMATION OF DETERMINISTIC AND STOCHASTIC PROCESSES IN HYDROLOGY,
W70-04258 02A

STOCK WATER
'ONE HUNDRED AND TWENTY-THREE FEET LONG' THE HORIZONTAL WELL AS A NEW METHOD OF RANGE WATER DEVELOPMENT,
W70-04396 04B

STORAGE COEFFICIENT
ON THE STORAGE COEFFICIENT OF FREE SURFACE AQUIFERS, CONSIDERING THE FLOW IN THE UNSATURATED ZONE (FRENCH),
W70-04124 02G

STORM DRAINS
THE CHICAGO SEWER SYSTEM, 100 YEARS OF PROTECTING CHICAGO'S HEALTH,
W70-04438 08A

STORM SEWERS
THE SEWERAGE AND DRAINAGE PROBLEM,
W70-04431 04A

STREAMFLOW
STATISTICAL SUMMARIES OF ILLINOIS STREAMFLOW DATA,
W70-04091 02E

STREAMFLOW FORECASTING
SIMULATION OF DAILY STREAMFLOW,
W70-04130 02E

SOME CONSIDERATIONS IN THE ADAPTION OF MARKOV PROCESS THEORY TO RAINFALL-RUNOFF PHENOMENON,
W70-04254 02A

NEW METHODS OF PROBABILITY CALCULATIONS FOR DISCHARGES AND NON-SCOURING VELOCITIES IN RIVERS' CROSS-SECTIONS,
W70-04255 02J

A STATISTICAL METHOD TO SEARCH FOR A RAINFALL-RUNOFF RELATIONSHIP,
W70-04256 02A

ANALYSIS OF 'BLACK BOX' RELATIONSHIP BETWEEN RAINFALL AND RUNOFF,
W70-04257 02A

A CASE FOR THE SIMULTANEOUS APPLICATION OF DETERMINISTIC AND STOCHASTIC METHODS IN HYDROLOGY,
W70-04259 04A

STREAMS
CHEMICAL AND RADIOCHEMICAL ANALYSES OF WATER FROM STREAMS, RESERVOIRS, WELLS, AND SPRINGS IN THE BULLSON PROJECT AREA, GARFIELD AND MESA COUNTIES, COLORADO,
W70-04307 02K

STRESS DISTRIBUTION
ELECTRICAL STRESS IN OIL-FILLED AND SOLID-TYPE HIGH VOLTAGE DIRECT CURRENT CABLES UNDER THERMAL AND ELECTRICAL TRANSIENT CONDITIONS,
W70-04139 08C

STRUCTURAL DESIGN
TOWER DESIGNS FOR AEP 765-KV PROJECT,
W70-04265 08C

SUBARCTIC
A SUMMARY OF SEASONAL TEMPERATURE AND PRECIPITATION DATA FOR THE INTERIOR FORESTED AREA OF ALASKA,
W70-04066 02B

NITRATE DISTRIBUTION IN THE SUBARCTIC NORTHEAST PACIFIC OCEAN,
W70-04168 02L

SUBSTITUTION METHOD
ALTERNATIVE APPROACHES TO THE PRODUCTION PROGRAMMING PROBLEM,
W70-04529 06A

SUBSURFACE DRAINAGE
AGRICULTURAL DRAINAGE AND EUTROPHICATION,
W70-04504 05C

SUBSURFACE FLOW
STORM RUNOFF FROM FORESTED CATCHMENTS BY SUBSURFACE ROUTES,
W70-04065 02G

SUBSURFACE RUNOFF
STORM RUNOFF FROM FORESTED CATCHMENTS BY SUBSURFACE ROUTES,
W70-04065 02G

SUBSURFACE WATERS
GEORGIA WATER LAW (SUBTERRANEAN WATERS, PERCOLATING WATERS SUBTERRANEAN STREAMS, SPRINGS),
W70-04207 06E

SUCCESSION
ANNUAL CYCLE, SPECIES DIVERSITY AND SUCCESSION OF PHYTOPLANKTON IN LOWER SARONICOS BAY, AEGEAN SEA,
W70-04450 05C

SUDAN
A STUDY OF CERTAIN PHYSICAL PROPERTIES OF A VERTISOL IN THE GEZIRA AREA, REPUBLIC OF SUDAN,
W70-04421 02G

SULFUR DIOXIDE
THE RIGHT TO A CLEAN ENVIRONMENT,
W70-04252 05C

SUNFLOWERS
EFFECTS OF WATER POTENTIAL ON GERMINATION OF LETTUCE, SUNFLOWER, AND CITRUS SEEDS,
W70-04416 02I

SUPPLY
THE DEMAND AND SUPPLY OF OUTDOOR RECREATION, AN ECONOMETRIC ANALYSIS,
W70-04511 06D

SURFACE DRAINAGE
PHYSICAL, LEGAL AND ECONOMIC ASPECTS OF ASSESSMENT OF COSTS AMONG DRAINAGE DISTRICTS LEGAL PHASE,
W70-04047 06E

SURFACE RUNOFF
RUNOFF FROM FOREST AND AGRICULTURAL WATERSHEDS,
W70-04055 02A

GEORGIA WATER LAW (DIFFUSED SURFACE WATERS),
W70-04206 06E

NICHOLSON V HOLLOWAY PLANTING COMPANY (SERVITUDE OF DRAIN).
W70-04234 04A

RUNOFF AND SEDIMENT AS NUTRIENT SOURCES,
W70-04272 05C

CONTROLLING NUTRIENTS AND ORGANIC TOXICANTS IN RUNOFF,
W70-04273 05C

SURFACE WATERS
THE CURRENT TRITIUM CONTENTS OF NATURAL WATERS,
W70-04116 02K

GEORGIA WATER LAW (DIFFUSED SURFACE WATERS),
W70-04206 06E

SURFACE WATER RESOURCES OF SOUTH AFRICA,
W70-04334 02E

DIFFERENCES IN SOIL CHEMISTRY INDUCED BY EVAPORATION AND FLOW OF GROUNDWATER,
W70-04340 02G

SURFACE-GROUNDWATER RELATIONSHIPS
STUDY OF THE INTERRELATIONSHIP BETWEEN SURFACE AND UNDERGROUND WATERS IN THE AY RIVER BASIN (RUSSIAN),
W70-04110 02A

SURFACTANT
FINISHING CHEMICALS FOR KNIT GOODS SHOULD THEY REALLY BE BIODEGRADABLE,
W70-04167 05D

SURFACTANTS
PRACTICAL IMPLICATIONS OF WATER REPELLENCY OF SOILS,
W70-04395 02G

SURVEYS
HYDROLOGICAL DOCUMENTATION FOR THE EXPLOITATION OF RESERVOIRS IN PERMEABLE SOLID ROCKS FOR THE PURPOSE OF ARTIFICIAL INFILTRATION,
W70-04118 03B

ACID MINE DRAINAGE IN APPALACHIA.
W70-04328 05G

HYDROGEOLOGICAL INVESTIGATIONS AND ESTIMATION OF FRESH GROUNDWATER RESOURCES IN COASTAL AREAS,
W70-04357 02F

SUSPENDED LOAD
EFFECT OF CONCENTRATION ON SEDIMENT DISTRIBUTION,
W70-04320 02J

SUSPENDED SEDIMENT
AN ELECTRO-OPTICAL SYSTEM FOR MEASUREMENT OF MEAN AND STATISTICAL PROPERTIES OF SEDIMENT SUSPENSIONS,
W70-04492 02J

SWAMPS
PRELIMINARY DETERMINATIONS OF HYDROBIOLOGICAL CONDITIONS IN THE VICINITY OF THE PROPOSED JETPORT AND OTHER AIRPORTS IN SOUTH FLORIDA, JULY 1969,
W70-04078 04C

SYNDIOTACTIC MEMBRANES
SYNTHESIS AND EVALUATION OF NEW MEMBRANE CANDIDATES FOR APPLICATION IN REVERSE OSMOSIS,
W70-04083 03A

SYNTHETIC HYDROLOGY
SIMULATION OF DAILY STREAMFLOW,
W70-04130 02E

SOME CONSIDERATIONS IN THE ADAPTION OF MARKOV PROCESS THEORY TO RAINFALL-RUNOFF PHENOMENON,
W70-04254 02A

SYNTHETIC RESINS
ADHESIVES, 1969,
W70-04132 08G

SYSTEMS ANALYSIS
POTOMAC ESTUARY MATHEMATICAL MODEL,
W70-04077 05E

A STATISTICAL METHOD TO SEARCH FOR A RAINFALL-RUNOFF RELATIONSHIP,
W70-04256 02A

ANALYSIS OF 'BLACK BOX' RELATIONSHIP BETWEEN RAINFALL AND RUNOFF,
W70-04257 02A

EFFECTS OF ENRICHMENT IN MATHEMATICAL MODELS,
W70-04363 05C

DIGITAL COMPUTER SIMULATION OF ECOLOGICAL SYSTEMS,
W70-04458 06A

TAMAR ESTUARY(ENGLAND)
ON THE DISTRIBUTION OF MAJOR NUTRIENTS AND PHYTOPLANKTON IN THE TAMAR ESTUARY,
W70-04192 02L

TARAPACA PROVINCE
AGRARIAN STRUCTURE IN THE PIEDMONT OASES OF TARAPACA PROVINCE (IN SPANISH),
W70-04410 03F

TARGETS
PUBLIC ECONOMICS,
W70-04514 06C

TAXES
DRAINAGE DISTRICTS (CONNECTING SYSTEMS AND TAXATION).
W70-04266 04A

PUBLIC ECONOMICS,
W70-04514 06C

TAXONOMIC KEY
KEYS TO WATER QUALITY INDICATIVE ORGANISMS (SOUTHEASTERN UNITED STATES),
W70-04281 05A

TELEMETERING EQUIPMENT
COMPARISON OF COSTS OF REMOTE CONTROL AND MANUAL OPERATION,
W70-04528 06C

TEMPERATURE
HEMATOLOGICAL ASPECTS OF THE THERMOACCLIMATORY PROCESS IN THE RAINBOW TROUT, SALMO GAIRDNERI,
W70-04470 05C

SIMILAR SOLUTIONS OF TURBULENT BOUNDARY LAYER HEAT AND MASS TRANSFER PROBLEMS,
W70-04472 08B

DEVELOPMENT OF A MATHEMATICAL MODEL FOR PREDICTION OF TEMPERATURE IN DEEP RESERVOIRS-PHASE II HIGH DISCHARGE-VOLUME RATIO RESERVOIRS,
W70-04473 06A

EFFECTS OF DAM CONSTRUCTION ON TEMPERATURES OF COLUMBIA RIVER,
W70-04474 05E

PREDICTION OF THERMAL ENERGY DISTRIBUTION IN DEEP RESERVOIRS,
W70-04476 02H

TEMPERATURE CONTROL OF RESERVOIR RELEASES INTO NOLIN AND BARREN TAILWATERS,
W70-04478 02H

MATHEMATICAL SIMULATION OF THERMAL STRATIFICATION IN DEEP IMPOUNDMENTS,
W70-04481 02H

DEVELOPMENT OF A MATHEMATICAL MODEL FOR PREDICTION OF TEMPERATURE IN DEEP RESERVOIRS PHASE I LOW DISCHARGE VOLUME RATIO RESERVOIRS,
W70-04483 06A

A MATHEMATICAL MODEL OF STREAM TEMPERATURE,
W70-04487 05B

TEMPERATURE CONTROL
TEMPERATURE CONTROL OF RESERVOIR RELEASES INTO NOLIN AND BARREN TAILWATERS,
W70-04478 02H

TEMPERATURE DISTRIBUTION
FORCE ON A SMALL SPHERICAL EVAPORATING PARTICLE IN ITS PURE VAPOUR DUE TO MOTION AND TEMPERATURE GRADIENTS,
W70-04480 08E

TERTIARY TREATMENT
REGENERATION OF SPENT GRANULAR ACTIVATED CARBON,
W70-04297 05D

COST AND PERFORMANCE ESTIMATES FOR TERTIARY WASTEWATER TREATING PROCESSES,
W70-04298 05D

PRODUCTION OF CHANNEL CATFISH (ICTALURUS PUNCTATUS) IN TERTIARY TREATMENT PONDS,
W70-04445 05F

TEST PROCEDURES
COMPOSITION OF INTERSTITIAL WATERS OF MARINE SEDIMENTS TEMPERATURE OF SQUEEZING EFFECT,
W70-04075 02K

TEST RESULTS
MODEL AND PROTOTYPE TESTS OF BUOYANT SPILLWAY GATES,
W70-04264 08B

TOWER DESIGNS FOR APP 765-KV PROJECT,
W70-04265 08C

TEXAS
GROUNDWATER RESOURCES OF GREGG AND UPSHUR COUNTIES, TEXAS,
W70-04092 02F

GROUNDWATER RESOURCES OF KERR COUNTY, TEXAS,
W70-04093 02F

FLOOD PLAIN INFORMATION, SALADO CREEK, SAN ANTONIO, TEXAS.

W70-04100 04A

TEXTILE CHEMICALS
THE BIOCHEMICAL OXYGEN DEMAND OF TEXTILE CHEMICALS UPDATED LIST 1966.
W70-04240 05D

TEXTILE WASTES
PROGRESS AND DEVELOPMENTS IN TREATMENT OF INTEGRATED TEXTILE MILL WASTES,
W70-04060 05D

BIOLOGICAL TREATMENT OF HIGHLY-ALKALINE TEXTILE MILL WASTE-SEWAGE MIXTURE.
W70-04084 05D

THAWING
THE INFLUENCE OF FREEZING AND THAWING ON SOIL MOISTURE,
W70-04112 02C

THEORETICAL ANALYSIS
ROCKBOLTING OF TUNNELS FOR STRUCTURAL SUPPORT, PART I -- THEORETICAL ANALYSIS, PART II--DESIGN OF ROCKBOLT SYSTEMS,
W70-04142 08E

THE DEMAND AND SUPPLY OF OUTDOOR RECREATION, AN ECONOMETRIC ANALYSIS,
W70-04511 06D

THERMAL POLLUTION
BIOLOGICAL EFFECTS OF THERMAL DISCHARGES ANNUAL PROGRESS REPORT FOR 1968,
W70-04157 05C

RESPONSES OF SALMONID FISHES TO ACUTE THERMAL SHOCK,
W70-04158 05C

PASSAGE OF DOWNSTREAM MIGRANTS,
W70-04159 05C

EFFECTS OF CHRONIC VARIABLE WATER TEMPERATURES ON SURVIVAL AND GROWTH OF YOUNG CHINOOK SALMON,
W70-04160 05C

BEHAVIOR OF SONIC-TAGGED CHINOOK SALMON AND STEELHEAD TROUT MIGRATING EAST HANDFORD THERMAL DISCHARGES,
W70-04161 05C

THE FOOD AND FEEDING OF JUVENILE CHINOOK SALMON IN THE COLUMBIA RIVER AT HANFORD,
W70-04162 05C

EFFECTS OF DAM CONSTRUCTION ON TEMPERATURES OF COLUMBIA RIVER,
W70-04474 05E

THERMAL PROPERTIES
PHYSICAL PROPERTIES OF SEA WATER SOLUTIONS HEAT CAPACITY,
W70-04325 01A

THERMAL RESISTANCE
RESPONSES OF SALMONID FISHES TO ACUTE THERMAL SHOCK,
W70-04158 05C

PASSAGE OF DOWNSTREAM MIGRANTS,
W70-04159 05C

EFFECTS OF CHRONIC VARIABLE WATER TEMPERATURES ON SURVIVAL AND GROWTH OF YOUNG CHINOOK SALMON,
W70-04160 05C

THERMAL SHOCK
RESPONSES OF SALMONID FISHES TO ACUTE THERMAL SHOCK,
W70-04158 05C

PASSAGE OF DOWNSTREAM MIGRANTS,
W70-04159 05C

THE RESPONSE OF JUVENILE SALMONIDS TO ACUTE THERMAL SHOCK,
W70-04163 05C

THERMAL STRATIFICATION
DEVELOPMENT OF A MATHEMATICAL MODEL FOR PREDICTION OF TEMPERATURE IN DEEP RESERVOIRS-PHASE II HIGH DISCHARGE-VOLUME RATIO RESERVOIRS,
W70-04473 06A

PREDICTION OF THERMAL ENERGY DISTRIBUTION IN DEEP RESERVOIRS,
W70-04476 02H

NATURAL PROCESSES AND THEIR INFLUENCE ON RESERVOIR WATER QUALITY,
W70-04479 02H

MATHEMATICAL SIMULATION OF THERMAL STRATIFICATION IN DEEP IMPOUNDMENTS,
W70-04481 02H

DEVELOPMENT OF A MATHEMATICAL MODEL FOR PREDICTION OF TEMPERATURE IN DEEP RESERVOIRS PHASE I LOW DISCHARGE VOLUME RATIO RESERVOIRS,
W70-04483 06A

IMPOUNDMENT DESTRATIFICATION FOR RAW WATER QUALITY CONTROL USING EITHER MECHANICAL OR DIFFUSED AIR PUMPING,
W70-04484 05F

THERMAL STRESS
BIOLOGICAL EFFECTS OF THERMAL DISCHARGES ANNUAL PROGRESS REPORT FOR 1968,
W70-04157 05C

RESPONSES OF SALMONID FISHES TO ACUTE THERMAL SHOCK,
W70-04158 05C

PASSAGE OF DOWNSTREAM MIGRANTS,
W70-04159 05C

THE RESPONSE OF JUVENILE SALMONIDS TO ACUTE THERMAL SHOCK,
W70-04163 05C

THERMAL TOLERANCE
THE RESPONSE OF JUVENILE SALMONIDS TO ACUTE THERMAL SHOCK,
W70-04163 05C

THERMODYNAMIC BEHAVIOR
AN EXPERIMENTAL STUDY OF THE STRUCTURE, THERMODYNAMICS AND KINETIC BEHAVIOR OF WATER,
W70-04085 01A

APPLICATION OF THERMODYNAMICS TO SOIL MOISTURE,
W70-04117 02G

THERMODYNAMICS
APPLICATION OF THERMODYNAMICS TO SOIL MOISTURE,
W70-04117 02G

THREE STAGE LEAST SQUARES
COMPUTATION OF ZELLNER-THEIL'S THREE STAGE LEAST SQUARES ESTIMATES,
W70-04523 06A

TIDAL EFFECTS
PRELIMINARY STUDIES ON PRIMARY PRODUCTIVITY AT PAYAKONDA, GULF OF KANDALAKSHA, WHITE SEA,
W70-04454 05C

TIDES
PRELIMINARY STUDIES ON PRIMARY PRODUCTIVITY AT PAYAKONDA, GULF OF KANDALAKSHA, WHITE SEA,
W70-04454 05C

TIDEWATERS
GEORGIA WATER LAW (NAVIGABLE STREAMS, TIDEWATERS),
W70-04204 06E

TOLERANCE
A CHEMICAL SELECTIVELY LETHAL TO SQUAWFISH (PTYCHOCHEILUS OREGONENSIS AND P. UMPQUAE),
W70-04145 05C

ACUTE TOXICITY OF THE INSECTICIDE SEVIN AND ITS HYDROLYTIC PRODUCT 1-NAPHTHOL TO SOME MARINE ORGANISMS,
W70-04165 05C

TOLERANCES
PESTICIDE TOLERANCES OF SELECTED FRESHWATER INVERTEBRATES,
W70-04149 05C

REDUCED OXYGEN TOLERANCE AND TOXICITY OF PETROLEUM PRODUCTS TO JUVENILE AMERICAN SHAD,
W70-04166 05C

TOPOGRAPHY
FUNCTIONAL RELATIONSHIPS BETWEEN DENUDATION, RELIEF, AND UPLIFT IN LARGE MID-LATITUDE DRAINAGE BASINS,
W70-04076 02J

TOXICITY
LETHAL EFFECTS OF 1888 CHEMICALS UPON FOUR SPECIES OF FISH FROM WESTERN NORTH AMERICA,
W70-04154 05C

TOXICITY AND ENVIRONMENTAL REQUIREMENTS OF A STRAIN OF APHANIZOMENON FLOS-AQUAE (L) RALFS,
W70-04282 05C

TOXINS
LETHAL EFFECTS OF 1888 CHEMICALS UPON FOUR SPECIES OF FISH FROM WESTERN NORTH AMERICA,
W70-04154 05C

TRACE ELEMENTS
DETERMINATION OF MERCURY IN NATURAL WATERS BY COLLECTION ON SILVER SCREENS,
W70-04341 02K

TRACERS
A GENERALIZED THEORY ON HYDRODYNAMIC DISPERSION IN POROUS MEDIA,
W70-04129 02F

NITROGEN METABOLISM IN LAKES. III. TRACER STUDIES OF THE ASSIMILATION OF INORGANIC NITROGEN SOURCES,
W70-04196 02H

TWO-DIMENSIONAL DISPERSION IN A GRANULAR-MEDIUM DISK SOURCE EMITTING AT CONSTANT RATE,
W70-04339 02F

TRACKING TECHNIQUES
ISOTOPIC COMPOSITION AND ORIGIN OF THE ATMOSPHERIC WATER VAPOR IN THE REGION OF LAKE LEMAN (IN FRENCH),
W70-04304 02K

TRANSIENT STRESS
ELECTRICAL STRESS IN OIL-FILLED AND SOLID-TYPE HIGH VOLTAGE DIRECT CURRENT CABLES UNDER THERMAL AND ELECTRICAL TRANSIENT CONDITIONS,
W70-04139 08C

TRANSMISSION TOWERS
TOWER DESIGNS FOR AEP 765-KV PROJECT,
W70-04265 08C

TRANSMISSION(ELECTRICAL)
WHAT ARE THE PROSPECTS FOR HV AND EHV UNDERGROUND TRANSMISSION SYSTEMS,
W70-04136 08C

TRANSPORTATION
HIGHWAYS, BRIDGES AND FERRIES.
W70-04490 06E

TREATMENT FACILITIES
BIOLOGICAL TREATMENT OF INDUSTRIAL EFFLUENTS,
W70-04087 05D

REGENERATION OF SPENT GRANULAR ACTIVATED CARBON,
W70-04297 05D

CHICAGO'S SOUTH DISTRICT FILTRATION PLANT.
W70-04437 05F

TRENDING METHOD
WATER UTILITY COST TRENDS,
W70-04524 03D

TRIAXIAL SHEAR
EFFECT OF WATER CONTENT ON THE SHEAR CHARACTERISTICS OF GRANULAR SOILS SUCH AS SEIBASU,
W70-04263 08D

TRITIUM
THE CURRENT TRITIUM CONTENTS OF NATURAL WATERS,
W70-04116 02K

TROPHIC ECOLOGY
SOME ASPECTS OF FEEDING IN ZOOPLANKTON,
W70-04502 05C

TROUT LAKES
BIOLOGY OF THE CRAYFISH ORCONECTES CAUSEYI AND ITS USE FOR CONTROL OF AQUATIC WEEDS IN TROUT LAKES,
W70-04500 02H

TUNDRA EROSION
SOIL MOVEMENT IN AN ALPINE AREA,
W70-04059 02J

TUNNEL SUPPORTS
ROCKBOLTING OF TUNNELS FOR STRUCTURAL SUPPORT, PART I -- THEORETICAL ANALYSIS, PART II--DESIGN OF ROCKBOLT SYSTEMS,
W70-04142 08E

TUNNELS
ROCKBOLTING OF TUNNELS FOR STRUCTURAL SUPPORT, PART I -- THEORETICAL ANALYSIS, PART II--DESIGN OF ROCKBOLT SYSTEMS,
W70-04142 08E

TURBULENCE
ROTARY FLOW METER AS TURBULENCE TRANSDUCER,
W70-04308 07B

THE RELATION OF TURBULENCE TO DEPOSITION OF MAGNETITE OVER RIFFLES,
W70-04343 02J

TURBULENT BOUNDARY LAYERS
SIMILAR SOLUTIONS OF TURBULENT BOUNDARY LAYER HEAT AND MASS TRANSFER PROBLEMS,
W70-04472 08B

TURBULENT FLOW
TRANSPIRATIONAL HEAT TRANSFER FROM A CYLINDER IN CROSS FLOW INCLUDING THE EFFECTS OF TURBULENT INTENSITY,
W70-04477 08E

UNDERGROUND
WHAT ARE THE PROSPECTS FOR HV AND EHV UNDERGROUND TRANSMISSION SYSTEMS,
W70-04136 08C

UNDERGROUND CABLES
WHAT ARE THE PROSPECTS FOR HV AND EHV UNDERGROUND TRANSMISSION SYSTEMS,
W70-04136 08C

UNDERGROUND STREAMS
GEORGIA WATER LAW (SUBTERRANEAN WATERS, PERCOLATING WATERS SUBTERRANEAN STREAMS, SPRINGS),
W70-04207 06E

UNIT HYDROGRAPH
RUNOFF FROM FOREST AND AGRICULTURAL WATERSHEDS,
W70-04055 02A

UNITED STATES
THE CRITICAL BALANCE SUPPLY VS DEMAND IN WATER USE,
W70-04319 06D

UNSATURATED FLOW
THE CONTINUITY BETWEEN GROUNDWATER FLOW SYSTEMS AND FLOW IN THE UNSATURATED ZONE,
W70-04113 02G

UNSTEADY FLOW
THE INTERACTION OF INTERNAL WAVES WITH AN UNSTEADY NON-UNIFORM CURRENT,
W70-04326 02E

UPTAKE
THE KINETICS OF NITRATE AND AMMONIA UPTAKE BY NATURAL POPULATIONS OF MARINE PHYTOPLANKTON,
W70-04279 05C

URBAN WASTES
ALGAE AND METROPOLITAN WASTES.
W70-04506 05C

URBANIZATION
WATER FOR THE CITIES--THE OUTLOOK,
W70-04423 06D

THE SEWERAGE AND DRAINAGE PROBLEM,
W70-04431 04A

USSR
KARST AND ASSOCIATED UNDERGROUND WATERS OF THE SOUTHWESTERN PART OF THE DONETS BASIN (RUSSIAN),
W70-04106 02F

KARST FORMATION AT THE ARTEMOVSK OCCURRENCE OF ROCK SALT (RUSSIAN),
W70-04107 02J

SOME CHARACTERISTICS OF RIVER AND SPRING RUNOFFS IN THE KARSTIC AREAS OF ESTONIA (RUSSIAN),

WATER TEMPERATURE EFFECTS
A CHEMICAL SELECTIVELY LETHAL TO SQUAWFISH (PTYCHOCHEILUS OREGONENSIS AND P. UMPQUAE),
W70-04145 05C

WATER TREATMENT
DISPOSAL OF WASTES FROM WATER TREATMENT PLANTS.
W70-04212 05D

CHICAGO'S SOUTH DISTRICT FILTRATION PLANT.
W70-04437 05F

WATER UPTAKE
AN EXPERIMENTAL STUDY OF THE UPTAKE OF WATER BY SOYBEAN ROOTS,
W70-04069 02D

WATER UTILIZATION
THE CRITICAL BALANCE SUPPLY VS DEMAND IN WATER USE,
W70-04319 06D

WATER WELLS
CHEMICAL AND RADIOCHEMICAL ANALYSES OF WATER FROM STREAMS, RESERVOIRS, WELLS, AND SPRINGS IN THE RULISON PROJECT AREA, GARFIELD AND MESA COUNTIES, COLORADO,
W70-04307 02K

WATER WORKS
POWERS OF GAS, ELECTRIC OR WATER COMPANIES.
W70-04236 03E

CHICAGO'S SOUTH DISTRICT FILTRATION PLANT.
W70-04437 05F

MUNICIPALLY OWNED UTILITIES CITIES SUPPLIED WITH WATER FROM OTHER CITIES.
W70-04466 03D

MUNICIPAL CORPORATIONS.
W70-04525 03D

WATER SUPPLY.
W70-04537 03D

MUNICIPALLY OWNED UTILITIES WATERWORKS.
W70-04539 03D

WATER YIELD
THE STORAGE CAPACITY IN THE DUNEWATER CATCHMENT AREA OF AMSTERDAM AND ITS EFFECT ON THE WATER QUALITY,
W70-04121 03E

WATER ZONING
EFFLUENTS AND AFFLUENCE,
W70-04429 05G

WATERSHED MANAGEMENT
MISSOURI WATERSHED PROTECTION AND FLOOD PREVENTION LAW.
W70-04232 04D

DELAWARE RIVER BASIN COMPACT (WATERSHEDS, RECREATION, HYDROELECTRIC POWER, FINANCING, GENERAL PROVISIONS).
W70-04361 06E

APPLICATION OF A COMPUTER MODEL TO A DESERT WATERSHED,
W70-04397 02A

WAVES(WATER)
THE INTERACTION OF INTERNAL WAVES WITH AN UNSTEADY NON-UNIFORM CURRENT,
W70-04326 02E

WEATHER MODIFICATION
EFFECTS OF WEATHER MODIFICATION ON PLANT AND ANIMAL COMMUNITIES,
W70-04351 02B

WEED EXTRACTING STEEL CABLES
TREATMENT OF ALGAE AND WEEDS IN LAKES AT MADISON,
W70-04454 02H

WELDING
STAINLESS STEELS AND OTHER FERROUS ALLOYS,
W70-04133 08G

WELL REGULATIONS
DISPOSAL OF LIQUID WASTES BY INJECTION UNDERGROUND - NEITHER MYTH NOR PHILLENNIUM,
W70-04103 05E

WELLS
'ONE HUNDRED AND TWENTY-THREE FEET LONG' THE HORIZONTAL WELL AS A NEW METHOD OF RANGE WATER DEVELOPMENT,
W70-04396 04E

WELLS AND WASTES.
W70-04471 04E

WESTERN LAKE ERIE(OHIO)
ALGAE FROM WESTERN LAKE ERIE,
W70-04468 05C

WETTABILITY
ADHESIVES, 1969,
W70-04132 08G

PRACTICAL IMPLICATIONS OF WATER REPELLENCY OF SOILS,
W70-04395 02G

WILDLIFE
RECREATION, FISH, WILDLIFE FACILITIES.
W70-04239 06E

WINDS
COLD AIR DRAINAGE ON A FORESTED MOUNTAIN SLOPE,
W70-04444 02D

WINGED ELM
EFFECT OF MOISTURE STRESS ON THE ABSORPTION AND TRANSPORT OF HERBICIDES IN WOODY PLANTS,
W70-04418 02I

WISCONSIN
WISCONSIN'S FLOOD PLAIN MANAGEMENT PROGRAM.
W70-04169 04A

EFFECT OF WATERSHED COVER ON OVERLAND FLOW FROM A MAJOR STORM IN SOUTHWESTERN WISCONSIN,
W70-04316 02E

YEASTS
ECOLOGY AND CHARACTERIZATION OF YEASTS FROM AQUATIC REGIONS OF SOUTH FLORIDA,
W70-04367 05C

YEASTS FROM THE NORTH SEA,
W70-04368 05C

ZINC
THE CALCULATION OF THE ACUTE TOXICITY OF MIXTURES OF POISONS TO RAINBOW TROUT,
W70-04156 05C

ZONING
NATURAL RESOURCE PROTECTION THROUGH SHORELAND REGULATION WISCONSIN,
W70-04493 05G

ZOOPLANKTON
ZOOPLANKTON STANDING CROPS IN A NEW AND AN OLD OZARK RESERVOIR,
W70-04190 05C

PRIMARY PRODUCTION AND NUTRIENTS IN CRAC LAKE, A LANDLOCKED FIORD ON BAFFIN ISLAND,
W70-04446 02H

SOME ASPECTS OF FEEDING IN ZOOPLANKTON,
W70-04502 05C

1-NAPHTHOL
EFFECTS OF THE INSECTICIDE SEVIN ON SURVIVAL AND GROWTH OF THE COCKLE CLAM CLINOCARDIUM NUTALLI,
W70-04155 05C

PERSISTENCE OF CARBARYL IN THE MARINE ESTUARINE ENVIRONMENT. CHEMICAL AND BIOLOGICAL STABILITY IN AQUARIUM SYSTEMS,
W70-04164 05C

ACUTE TOXICITY OF THE INSECTICIDE SEVIN AND ITS HYDROLYTIC PRODUCT 1-NAPHTHOL TO SOME MARINE ORGANISMS,
W70-04165 05C

1-1'-METHYLENEDI-2-NAPHTHOL
A CHEMICAL SELECTIVELY LETHAL TO SQUAWFISH (PTYCHOCHEILUS OREGONENSIS AND P. UMPQUAE),
W70-04145 05C

2-4-5-T
EFFECT OF MOISTURE STRESS ON THE ABSORPTION AND TRANSPORT OF HERBICIDES IN WOODY PLANTS,
W70-04418 02I

PARATHION DEGRADATION IN LAKE SEDIMENTS,
W70-04303 05B

WISCONSIN UNIV., MADISON. DEPT. OF ZOOLOGY.
A CRITICAL EVALUATION OF THE TROPHIC LEVEL CONCEPT. I. ECOLOGICAL EFFICIENCIES,
W70-04251 02K

WISCONSIN UNIV., MADISON. WATER CHEMISTRY LAB.
ANALYTICAL CHEMISTRY OF PLANT NUTRIENTS,
W70-04382 05A

WISCONSIN UNIV., MILWAUKEE. CENTER FOR GREAT LAKE STUDIES.
STUDIES ON SOME INLAND WATERS OF THE GALAPAGOS,
W70-04453 05B

WOODWARD-CLYDE-SHEPARD AND ASSOCIATES, OAKLAND, CALIF. AND NAVAL FACILITIES ENGINEERING COMMAND, SAN BRUNO, CALIF. WESTERN DIV.
SAND DENSIFICATION BY PILES AND VIBROFLOTATION,
W70-04533 08D

YALE UNIV., NEW HAVEN, CONN.
COMPUTATION OF ZELLNER-THEIL'S THREE STAGE LEAST SQUARES ESTIMATES,
W70-04523 06A

ZURICH UNIV. (SWITZERLAND). CANTONAL LAB.
THE EUTROPHICATION OF LAKES AND RIVERS, CAUSE AND PREVENTION,
W70-04509 05C

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

SELECTED WATER RESOURCES ABSTRACTS

01. NATURE OF WATER

1A. Properties

ENERGY BALANCES FOR TRANSIENT WATER CRATERS,
Geological Survey, Menlo Park, Calif.
K. L. R. Olevson.
Available for sale from Superintendent of Documents, US Government Printing Office, Washington, DC 20402-Price $3.75. Geological Survey Research 1969, Professional Paper 650-D, p D189-D194, 1969. 6 p, 4 fig, 2 tab, 11 ref.

Descriptors: *Water properties, *Waves (Water), *Drops (Fluids), *Impact (Rainfall), Energy, Kinetics, Energy dissipation, Energy transfer.
Identifiers: *Raindrop craters (Water), Water craters (Impact), Liquid-liquid impacts.

Studies of transient craters in water, produced by falling water drops, show that significant amounts of energy are present as kinetic energy in a cylindrical wave which surrounds the crater when the crater has reached its maximum size. At maximum size, about 80 to 90% of the initial drop kinetic energy can be accounted for as potential energy, surface energy, and kinetic energy of the outwardly expanding cylindrical wave. The energy partitioning changes with velocity and crater size. For 14-milligram drops with velocities near 155 centimeters per second, surface energy is the most important energy sink, whereas potential energy is the most important energy sink at velocities near 566 cm per second. The percentage of kinetic energy in the cylindrical wave increases with increasing drop velocity and may exceed the percentage of surface energy for the highest velocities. (Knapp-USGS)

02. WATER CYCLE

2A. General

A STOCHASTIC MODEL OF CONVECTIVE DIFFUSION FROM A CONTINUOUS SOURCE,
Carnegie-Mellon Univ., Pittsburgh, Pa. Dept. of Civil Engineering.
George Bugliarello, and Eugene D. Jackson, III.
Text also printed in French. Journal of Hydraulic Research, Vol 7, No 2, p 177-204, 1969. 28 p, 12 fig, 1 tab, 9 ref.

Descriptors: *Diffusion, *Convection, *Mathematical models, Stochastic processes, Dispersion, Flow, Closed conduit flow, Steady flow, Statistical models, Tracers, Turbulent flow, Laminar flow.
Identifiers: Convective diffusion.

Stochastic methods can provide an alternative to conventional numerical techniques in the solution of the convective diffusion equation. A discrete model, consisting of a large number of particles, each executing in a discrete time interval a convective step and a random diffusive one, was used to simulate the diffusion pattern from continuous point sources in a laminar field. The treatment emphasizes methodological aspects and the type of information on the diffusion process that the simulation approach can most effectively provide. (Knapp-USGS)

PRECIPITATION AND BASE RUNOFF, BIG PIPE CREEK BASIN, MARYLAND,
Geological Survey, Washington, D.C.
Frank W. Trainer.
Available for sale from Superintendent of Documents U S Government Printing Office, Washington, D C 20402-Price $3.75. Geological Survey Research 1969, Professional Paper 650-D, p D222-D227, 1969. 6 p, 3 fig, 18 ref.

Descriptors: *Surface-groundwater relationships, *Rainfall-runoff relationships, *Base flow, Hydrograph analysis, Model studies, Maryland, Groundwater movement, Recession curves, Evaporation, Hydrologic budget, Hydrogeology, Streamflow.
Identifiers: Base runoff.

Base runoff from a small river basin in the Piedmont province in Maryland was studied through hydrograph separation during design of a study model depicting groundwater and base runoff in part of the Potomac River basin. Subsequent base runoff derived from individual storms, believed to be approximately equal to groundwater recharge resulting from these storms, ranges from 25 to 31% of the precipitation in February-April to 7 to 9% in July-September. On the average, a given quantity of precipitation results in three to four times as much base runoff during winter and spring as during summer and autumn. (Knapp-USGS)

POTENTIAL OF PHYSICAL MODELS FOR ACHIEVING BETTER UNDERSTANDING AND EVALUATION OF WATERSHED CHANGES,
Massachusetts Inst. of Tech., Cambridge.
Peter S. Eagleson.
In: Effects of Watershed Changes on Streamflow, Water Resources Symposium No 2, Austin, Texas, October 1968, p 12-25, University of Texas Press, Austin and London, 1969. 14 p, 5 fig, 22 ref.

Descriptors: *Rainfall-runoff relationships, *Model studies, *Hydraulic models, *Mathematical models, Statistical models, Hydraulic similitude, Simulation analysis, Routing, Runoff, Streamflow forecasting, Probability, Urbanization.
Identifiers: Watershed models, Watershed changes.

The construction, operation, and interpretation of hydraulic models and mathematical models of the rainfall-runoff relationships of watersheds are discussed. Emphasis is given to the effects of man made changes in watershed properties on their hydrologic performance. It is concluded that while there appears to be a class of watershed problems for which scale modeling may be a legitimate method study, the class is small and is included in that larger class for which digital computer solution of the equations of motion shows at least equal promise. The errors inherent in each approach have yet to be defined, but the digital computer should ultimately have a clear economic advantage. (See W70-04723). (Knapp-USGS)

EFFECT OF STORM RAINFALL VARIABILITY ON RUNOFF FROM SMALL SEMIARID WATERSHEDS,
Arizona Water Resources Research Center, Tucson.
Martin M. Fogel.
American Society of Agricultural Engineers, Transactions, Vol 12, No 6, p 808-812, November-December, 1969. 3 fig, 4 tab, 8 ref.

Descriptors: *Rainfall-runoff relationships, *Storm runoff, *Small watersheds, *Semiarid climates, *Regression analysis, Arizona, Seasonal, Summer, Precipitation (Atmospheric), Rainfall, Surface runoff, Duration, Spatial distribution, Variability, Convection, Depth-Area-Duration analysis, Equations, Storms, Estimating, Frequency analysis.
Identifiers: *Atterbury experimental watershed.

In the small semiarid watershed under study convective summer storms produce the heaviest runoff. The intensity, duration, frequency, and areal extent of these storms differ markedly from other storm types. A linear multiple-regression model was used in an attempt to discover the relative effects of depth of rainfall, its time distribution, and position of the storm over the watershed. Location of the storm had little or no effect on runoff if mean areal rainfall was used to characterize storm magnitude. The major influence in predicting runoff was mean rainfall, but time distribution of the storm did have a significant effect. In a comparison, the generally used U.S. Soil Conservation Service method was found to underestimate runoff for most storm rainfall depths and overestimate volume for extreme events. (Carr-Arizona)
W70-04910

2B. Precipitation

A GENERALIZED PROBABILITY MODEL FOR SEQUENCES OF WET AND DRY DAYS,
Liverpool Univ. (England).
J. R. Green.
Monthly Weather Review, Vol 98, No 3, p 238-241, March 1970. 4 p, 2 fig, 2 tab, 15 ref.

Descriptors: *Mathematical models, *Weather forecasting, Meteorology, Stochastic processes, Markov processes, Statistical models, Weather patterns.
Identifiers: Dry-day forecasts, Wet-day forecasts.

A generalization of the two main probability models used to describe runs of wet days or of dry days is given. The new model depends on only two parameters and is shown to fit a large proportion of available sets of data. (Knapp-USGS)
W70-04695

REMARKABLE POINT RAINFALL AT GREENFIELD, N.H., EVENING OF AUGUST 2, 1966,
Environmental Science Services Administration, Boston, Mass.
R. E. Lautzenheiser, A. E. Rothovius, and J. R. Sims.
Monthly Weather Review, Vol 98, No 2, p 164-168, February 1970. 5 p, 5 fig, 8 ref.

Descriptors: *Rainfall, *Rainfall intensity, *Distribution patterns, *New Hampshire, Rainfall disposition, Meteorology.
Identifiers: Small rain storms.

An excessive rain of very small areal extent fell late on Aug. 2, 1966, at Greenfield, N.H. The storm is described, related storm statistics are presented, the synoptic situation is reviewed, and the danger of interpreting point rainfall data as being representative of an area is shown. (Knapp-USGS)
W70-04698

A STATISTICAL SIMULATION TECHNIQUE FOR NORTHERN NEW JERSEY MONTHLY PRECIPITATION,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Meteorology.
Peter P. Zwack, Mark D. Shulman, and John W. Philpot.
Water Resources Bulletin, Vol 5, No 4, p 9-15, December 1969. 7 p, 1 fig, 4 tab, 14 ref.

Descriptors: *Precipitation (Atmospheric), *New Jersey, *Simulated rainfall, *Statistical models, *Synthetic hydrology, Simulation analysis, Rainfall disposition, Statistics, Model studies, Mathematical models, Computers, Time series analysis.
Identifiers: Precipitation simulation.

A 30-year record of monthly precipitation for Northern New Jersey was analyzed for its statistical components. With a weak annual periodicity eliminated, the series was found to be random. The data for each month were fit with a gamma distribution using Thom's suggested best estimates of the distribution parameters. A 1,000-year simulated monthly precipitation series was generated using random values from the 12 gamma distributions. The statistical properties of the simulated and sample time series agreed well. Numerous anomalous precipitation regimes were observed in the simulated data. (Knapp-USGS)
W70-04718

A NOTE ON AREAL RAINFALL DEFINITION,
Agricultural Research Service, Beltsville, Md. Hydrograph Lab.
David M. Hershfield.
Water Resources Bulletin, Vol 5, No 4, p 49-55, December 1969. 7 p, 4 fig, 1 tab, 2 ref.

Descriptors: *Rainfall, *Distribution patterns, Statistical methods, Sampling, Mathematical studies, Probability, Instrumentation, Networks, Data collections, Rainfall disposition, Hydrology, Correlation analysis, Rain gages.
Identifiers: Rain gage networks.

Sources of error in defining areal rainfall on a storm basis include the instrumental error, sampling fluctuations over the area, and network density. Analysis of dense rain gage data show the magnitude of the errors resulting from the natural variability of rainfall. Except for one watershed in Arizona, the coefficient of variation, based on a sample of storm totals from the individual gages in various size areas, remains relatively constant with increasing area for a particular storm. The error due to rainfall variability over the area is probably the most important and must be considered in experiments which attempt to resolve small-area hydrologic problems. (Knapp-USGS)
W70-04719

FORECASTING SNOW AND RAIN FOR THE NEW YORK CITY AREA USING THE METHOD OF ORDERED STATISTICS,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Meteorology.
A. Roger Greenway, and Mark D. Shulman.
Water Resources Bulletin, Vol 5, No 4, p 56-62, December 1969. 7 p, 1 tab, 6 ref.

Descriptors: *Weather forecasting, *Snow, *New York, Meteorology, Weather patterns, Precipitation (Atmospheric).
Identifiers: Snow forecasting.

The occurrence of rain and snow for New York City is examined in relation to atmospheric parameters at three levels for four first order weather bureau stations. An objective forecasting guide is developed using order statistic properties. Incorporating surface and upper level data, the guide is a highly accurate forecast tool. (Knapp-USGS)
W70-04720

THE ANNUAL MARCH OF THE TOPOCLIMATIC SPATIAL PATTERNS OF NET RADIATION IN SOUTHERN CALIFORNIA,
California Univ., Los Angeles. Dept. of Geography.
Werner H. Terjung, Ronald N. Kickert, Ronald J. Kochevar, Jack P. Mrowka, and Simon O. Ojo.
Archiv Meteorologie, Geophysik, und Bioklimatologie, Series B, Vol 13, p 21-50, 1969. 30 p, 16 fig, 3 tab, 50 ref.

Descriptors: *Solar radiation, *Mathematical models, *Synoptic analysis, *California, *Climatology, Albedo, Smog, Clouds, Topography, Slopes, Altitude, Urbanization, Meteorology, Heat balance.
Identifiers: Southern California.

A model based on theoretical knowledge of the physical modifications of solar energy by the atmosphere and its transformation at the surface, has been used to determine the monthly distribution of net radiation in southern California at a topoclimatic scale. Parameters utilized in the equations were cloud cover, cloud type, surface albedo, precipitable water vapor, surface temperature, slope angle, slope orientation, elevation, and urban smog. A remarkable contrast was found between relatively high net radiation values for the littoral and coastal mountains and those of the lower values of the arid eastern parts of southern California. ASSESSMENT OF ATMOSPHERIC EFFECTS OF LAKE NASSER.
National Center for Atmospheric Research, Boulder, Colo.

In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 865-880, 1966. 16 p, 1 fig, 3 append.

Descriptors: *Lakes, *Climatology, *Arid lands, *Reservoirs, Microclimatology, Meteorology, Precipitation (Atmospheric), Synoptic analysis.
Identifiers: *Egypt, *Lake Nasser, *Nile River.

The possible meteorological effects of the filling of Lake Nasser, Egypt are discussed, considering information on final size of the lake. During the months of June, July and August, the Nile is in flood; the water flow is highest and the water temperatures lowest of the year. At this time, the basic circulation of the lower atmosphere in the region to be occupied by Lake Nasser is the most stable of the year; it is essentially from the north around the extended monsoon low over northwest India. Mean maximum daily temperatures at Aswan are approximately 42 deg C. Winds are calm to light in the early morning hours but by mid-morning pick up to about 10-15 meters per second, blowing generally as north-east trades, very nearly parallel to the main axis of the water body of Lake Nasser. There are no clouds, dew points range to - 4 deg C, and there are no intrusions of other air masses. It is the consensus of scientists queried that the influence, if any, will be on the micro-to-meso scale. There seems to be little reason to expect that the moisture entering the atmosphere from the lake will, in the absence of any possibility of uplift to adequately low temperatures, result in clouds, much less precipitation. While thunderstorms do occur in the region at certain times of the year, with concomitant winds at low levels strong enough to blow sand, there appears to be little expectation that the presence of the lake will have any significant influence on the frequency of occurrence or intensity of such thunderstorms. (Knapp-USGS)

SALT REJECTION BY SEA ICE DURING GROWTH,
Department of Energy, Mines and Resources, Dartmouth (Nova Scotia).
R. A. Lake, and E. L. Lewis.
Journal of Geophysical Research, Vol 75, No 3, p 583-597, January 20, 1970. 15 p, 10 fig, 1 tab, 18 ref.

Descriptors: *Sea ice, *Freezing, *Water chemistry, Sea water, Salts, Drainage, Structure, Physical properties, Crystal growth, Crystallization.
Identifiers: Salt rejection (Freezing).

Rejection of salt at a freezing ice-water interface takes place at least in part by cyclic convective processes occurring within the small interstitial spaces in the first few centimeters of ice above the interface. This invalidates the assumption of the

fusive boundary layer and shows that near-inter-
e temperatures are subject to cyclic variations.
is result should be generally true for phase
anges in aqueous solutions with floating ice, and
nust be considered as a modification to current
ories of solidification. Large vertical tubular
uctures with smaller tributary tubes exist in the
wing sea ice sheet; this arrangement indicates
rizontal migration of brine toward preferred
inage areas in a manner analogous to the
tchment area of a river and its tributaries. (K-
pp-USGS)

scriptors: *Snowpacks, *Vegetation effects,
orest management, Planting management, Snow
nagement, Watershed management, Red pine
es, Pine trees, Water yield.
ntifiers: Vegetation-snow cover relations.

snow accumulation study was conducted in a 33-
ar-old red pine plantation thinned to different
cking levels. Snowpack water content increased
average of 2% for each 10 square feet of basal
ea reduction, within the range of 60 to 180
uare feet of basal area. Reducing plantation
cking from 180 to 60 square feet of basal area
r acre would result in 1.4 to 1.9 inches of addi-
nal water in a winter when 6 to 8 inches of
ecipitation were received. (Knapp-USGS)

e fundamental properties of snow grain size,
ape, and fabric (relationship between grains)
re measured, and these were related to the index
derived properties of bulk density, shear and
nsile strength, permeability for air, and the
lectric static permittivity and loss tangent. It was
ssible to show that: (1) snow strength is a func-
n of bond area; and (2) the rate of densification
low density snow can be explained in part by
gh stress concentrations (on the order of 100 mil-
n dynes/sq cm) at intergranular contacts and by
ch factors as riming on crystals. The effect of the
vironmental factors of time, temperature, and
avitational stress is difficult to study in situ
cause they are not independent variables. How-
er, it appears that their study is simplified when
e fundamental properties of snow are correlated
th index properties. (Knapp-USGS)

ORE DRILLING THROUGH THE ANTARC-
C ICE SHEET,
my Terrestrial Sciences Center, Hanover, N.H.
rbert T. Ueda, and Donald E. Garfield.
Cold Regions Research and Engineering Laboratory Technical Report 231, December 1969. 19 p, 14 fig, 8 ref. DA Proj No 1T061101A91A.

Descriptors: *Ice, *Glaciers, *Antarctic, *Core drilling, Drilling, Rotary drilling, Drilling equipment, Sampling, Drill holes, Exploration, Subsurface investigations, Surveys, Drilling fluids, Heat flow.
Identifiers: Antarctic ice sheet, Ice coring.

The Antarctic ice sheet was penetrated by core drilling at Byrd Station during the 1967-68 austral summer. The drill was a cable-suspended electromechanical rotary type 87 ft long, weighing 2650 lb. Other equipment included 12,000 ft of armored electrical cable and a 70-ft-high aluminum tower. During 1966-67 the equipment was installed and a depth of 745 ft was drilled. Drilling resumed in November 1967 and the hole was completed in January 1968. Cores 10 to 20 ft long averaging 4 1/4 in. diam were recovered over 99% of the depth. The penetration rate averaged 70 ft/day. The drilling rate varied from 1.4 to 7.8 in./min at a power input of 7.5 to 9 kw. Drill cuttings were dissolved in an aqueous ethylene glycol solution circulated at the bottom of the hole and returned to the surface in the drill bailer on each coring run. Liquid water, indicative of pressure melting at the bottom of the ice sheet, was encountered at 7101 ft. Attempts to recover a core of sub-ice material were not successful. The hole began deviating from the vertical at 750-ft depth and, despite corrective measures, was inclined 15 deg at the bottom. Ice temperatures increased steadily from a minimum of -28.8 deg C at 2400 ft to -13.0 deg C at 5942 ft, where temperature measurement ceased. The heat flow for this location is estimated to be 1.8 microcal/sq cm/sec. (Knapp-USGS)

RELATIONSHIPS BETWEEN CLIMATE AND REGIONAL VARIATIONS IN SNOW-COVER DENSITY IN NORTH AMERICA,
Army Terrestrial Sciences Center, Hanover, N.H.
Michael A. Bilello.
Cold Regions Research and Engineering Laboratory Research Report 267, December 1969. 21 p, 6 fig, 3 tab, 26 ref, 1 append. DA Task 1T061102B52A02.

Descriptors: *Snow cover, *Climatology, *Density, Winds, Snow surveys, Temperature, Water yield, Snowfall.
Identifiers: *Snow density.

Analysis of snow-cover observations made during November to March at 27 stations in Alaska, Canada and the northern United States for a 2- to 11-year period showed that the average snow density can be classified in 4 general categories: Category 1 (density 0.20 to 0.23 g/cc), inland stations reporting light winds; Category 2 (0.24 to 0.27 g/cc), stations reporting moderate winds; Category 3 (0.28 to 0.30 g/cc), inland and coastal locations with stronger winds; Category 4 (0.32 to 0.36 g/cc), cold and windy stations of the Arctic. Skewness coefficients computed for each station showed bias toward lower densities for categories 1 and 2, and bias toward higher densities for categories 3 and 4. A nomograph in which the average winter air temperature and wind speed are the independent variables makes it possible to estimate the average snow-cover density for any location in the Arctic, subarctic and North Temperate Zones. A comparison between observed and estimated densities for 10 other test stations yielded a correlation coefficient of 0.91 with a standard error of estimate of 0.016 g/cc. An average snow density map of North America was drawn and the continent was divided into areas based on the 4 categories. (Knapp-USGS)

2D. Evaporation and Transpiration

THE EFFECT OF ALBEDO ON THE EVAPOTRANSPIRATION RATE,
Cornell Univ., Ithaca; New York State Coll. of Agriculture, Ithaca. Dept. of Agronomy.
Ido Seginer.
Agricultural Meteorology, Vol 6, No 1, p 5-31, January 1969. 12 fig, 3 tab, 20 ref.

Descriptors: *Model studies, *Albedo, *Irrigation effects, *Evapotranspiration control, *Soil surfaces, Solar radiation, Arid lands, Radiation, Equations, Energy budget, Air temperature, Absorption, Canopy, Irrigated land, Photosynthesis, Time, Wetting, Wind velocity.
Identifiers: *Net radiation, *Reflectivity.

A model was used to evaluate the possibility of increasing the albedo of irrigated fields in order to reduce evapotranspiration. The results indicate that for infinite homogeneous fields the major factors determining the evaporation rate were albedo and wetness of surface. Following treatment savings in water were calculated to be 30% for all wetness conditions, with a 30% relative reduction in net radiation and a 20% reduction in solar radiation absorbed at the surface. Field experiments will be necessary to test these predictions. (Carr-Arizona)
W70-04919

A MODEL FOR SIMULATING SOIL WATER REGIME IN ALTERNATING FALLOW-CROP SYSTEMS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Land Research and Regional Survey.
E. A. Fitzpatrick, and H. A. Nix.
Agricultural Meteorology, Vol 6, No 5, p 303-319, September 1969. 8 fig, 1 tab, 36 ref.

Descriptors: *Model studies, *Evaporation, *Evapotranspiration, *Soil water, *Fallowing, Crop production, Semiarid climates, Cotton, Sorghum, Wheat, Water loss, Water balance, Meteorological data, Climatology, Soil-water-plant relationships.
Identifiers: *Soil water reserves, Agronomic practices, Queensland, Australia.

A set of simple working functions depicting evaporative loss from an alternating fallow-crop system was used in a model for simulating soil water regime in sub-humid to semi-arid central Queensland. Despite inadequacies in the data, the model closely simulated changes over time in the soil water regime. This was achieved by using distinctive functions for fallowed and cropped intervals and by making evapotranspiration rates dependent upon status of available soil water and stage of crop development. Data were sufficient to allow formulation of functions for cotton, sorghum, and wheat. The model makes provision for future refinements in data and appears promising as a basis for assessing effects of varied agronomic practices on available soil water reserves. (Carr-Arizona)
W70-04920

CHANGES IN CANOPY RESISTANCE TO WATER LOSS FROM ALFALFA INDUCED BY SOIL WATER DEPLETION,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.; and Army Electronics Command, Fort Huachuca, Ariz. Atmospheric Sciences Lab.
C. H. M. Van Bavel.
Agricultural Meteorology, Vol 4, No 3, p 165-176, May 1967. 10 fig, 1 tab, 1 append, 19 ref.

Descriptors: *Evaporation, *Soil-water-plant relationships, *Moisture stress, *Canopy, *Irrigation effects, Plant physiology, Irrigation, Alfalfa, Arizona, Arid lands, Diurnal, Stomata, Water loss, Resistance, Equations, Meteorological data, Energy budget.

Identifiers: *Canopy resistance.

An Arizona alfalfa field was irrigated and then allowed to deplete its soil water reserves down to -15 bars. The ratio between actual and potential evaporation was followed hourly, and when it dropped significantly below unity was interpreted as canopy resistance to evaporation. This resistance followed a diurnal pattern, with low values in the early morning, a rapid increase in early afternoon, and a decrease toward evening. It was not until 20 days after irrigation that resistance became noticeable during the day. However, from that time until the end of the experiment resistance rose rapidly and on the last day of measurement showed a value of 15 sec/cm. It would appear from the data that alfalfa stomata hold evaporation to a daily maximum value which declines as soil water is depleted. (Carr- Arizona)
W70-04921

NET AND SOLAR RADIATION RELATIONS OVER IRRIGATED FIELD CROPS,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
Leo J. Fritschen.
Agricultural Meteorology, Vol 4, No 1, p 55-62. 1 tab, 12 ref. Jan 1967.

Descriptors: *Irrigation water, *Regression analysis, *Solar radiation, *Evapotranspiration, *Albedo, Irrigation design, Water conservation, Arid lands, Irrigation efficiency, Arizona, Radiation, Surfaces, On-site data collections, Meteorological data, Data collections, Analytical techniques, Crops.
Identifiers: *Net radiation, Linear regression.

In an attempt to determine the relation between solar radiation and net radiation, data were collected over field crops of alfalfa, barley, cotton, oats, sorghum, and wheat. Field data were analyzed by linear regression techniques and the standard error which resulted from the pooled data was 0.06 ly/min. If net radiation were estimated from solar radiation for a 12-hour day with 649 ly incoming radiation, a standard error of approximately 10% would result. This pooled regression would be sufficiently accurate to estimate evapotranspiration in the design of irrigation projects, but the error would be too large in cases needing daily evapotranspiration results. In studying the reflectivity of crop surfaces, it appears that water may be conserved by increasing the surface albedo of crops and of wet bare soil. (Carr-Arizona)
W70-04922

CLIMATE AND ESTIMATED WATER USE BY AN ORANGE ORCHARD,
California Univ., Riverside; and Arizona Agricultural Experiment Station, Tucson.
C. H. M. Van Bavel, J. E. Newman, and R. H. Hilgeman.
Agricultural Meteorology, Vol 4, No 1, p 27-37, January 1967. 4 tab, 10 ref.

Descriptors: *Evapotranspiration, *Climates, *Arid climates, *Orchards, *Water utilization, Oranges, Stomata, Canopy, Wind velocity, Arizona, Equations, Meteorological data, Leaves, Evaporation, Evaporation pans, Data collections, Air temperature, Analytical techniques, Resistance, Water vapor.
Identifiers: *Canopy resistance, Penman equation.

A modified Penman equation applied to commonly logged climatic data was used to estimate potential evapotranspiration from orange trees under arid conditions in Arizona. Due to canopy resistance to evaporation, actual water use was much lower than the potential rate. There were further indications that in an arid environment evaporation from citrus groves is inversely related to wind speed and that aging leaves show increased values of canopy resistance. These results demonstrate the potential value of a physical approach to the prediction of crop water use. (Carr-Arizona)
W70-04923

AN INDEX OF CROP WATER STRESS RELATED TO WHEAT AND GRAIN SORGHUM YIELDS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Land Research and Regional Survey.
H. A. Nix, and E. A. Fitzpatrick.
Agricultural Meteorology, Vol 6, No 5, p 321-337, September 1969. 4 fig, 4 tab, 3 append, 21 ref.

Descriptors: *Moisture stress, *Crop production, *Evapotranspiration, *Soil-water-plant relationships, *Soil water, Moisture deficit, Climatic data, Rainfall, Plant physiology, Wheat, Sorghum, Environmental effects, Data collections, Regression analysis, Phenology.
Identifiers: *Stress index, *Queensland, Australia.

Soil-water regimes for wheat and grain sorghum were studied in experiments in central Queensland. Analysis of the ratio of estimated actual to potential evapotranspiration at defined intervals of growth for both crops revealed a critical growth period from ear emergence to early grain development. Ratios calculated for this 'critical' period correlated more closely with yield than other indices used to characterize crop water environment. A simple index incorporating available soil water supply and potential evaporative demand gave highly significant correlations with yields. This index accounted for 60-83% of the yield variation within the different varieties under study. After checking these findings against wheat yield data in Queensland for the 1952-1965 period, it would appear that intra-seasonal and year-to-year variation in yield is largely a function of anthesis date in relation to the then prevailing environmental moisture stress. (Carr-Arizona)

2E. Streamflow and Runoff

HYDROLOGIC SYSTEM RELATED TO GEOLOGY AND SOILS, FOUR MILE CREEK AREA, TAMA COUNTY, IOWA,
Soil Conservation Service, Iowa City, Iowa; and Iowa State Water Resources Research Inst., Ames.
R. V. Ruhe, and W. J. Vreeken.
Available from the Clearinghouse as PB-190 166, $3.00 in paper copy, $0.65 in microfiche. Iowa State University Water Resources Research Institute Project Completion Report, December 31, 1969. 44 p, 37 fig, 5 plate, 1 tab, 15 ref. OWRR Project No A-014-IA.

Descriptors: *Hydrogeology, *Rainfall-runoff relationships, *Iowa, *Loess, Glacial drift, Topography, Geology, Discharge (Water), Runoff, Water yield, Base flow, Erosion, Scour, Channel morphology, Hydrographs, Statistical methods.
Identifiers: Four Mile Creek (Iowa), Tama County (Iowa).

Topography in the Four Mile Creek area, Iowa consists of stepped levels that rise along interfluves from the main valley to divides. The drainage net is incised along tributary and side streams. Maximum relief in the area is 135 feet. Wisconsin loess covers 54% of the area and buries paleosols and glacial till. The loess varies in thickness from 4 to 35 feet. Alluvium is confined to the main, tributary, and side valleys. The main valley alluvium occupies 22% of the area. In relatively drier years, runoff is only 4 to 6% of rainfall, and in wetter years, runoff may be 11 to 17% of rainfall. The hydrologic regimen within small first-order watersheds in loess is related to stratigraphic zoning in the loess reservoir and to topography inherited from paleogeomorphic surfaces. These surfaces have associated clayey paleosols that are more impermeable than the loess. Parts of the buried surfaces are cut in till, also more impermeable than the loess. Subsurface water transmits downward and laterally through the permeable loess reservoir above the buried surfaces to alluvium along the first-order drainage. The subsurface water subsequently flows to alluvium of higher order valleys in the drainage net and ultimately to the main alluvial body along Four Mile Creek. (Knapp-USGS)
W70-04545

VISUALIZATION OF SPIRAL MOTION IN CURVED OPEN CHANNELS OF LARGE WIDTH,
Imperial Coll. of Science and Techology, London (England).
J. R. D. Francis, and A. F. Asfari.
Nature, Vol 225, No 5234, p 725-728, February 1970. 4 p, 8 fig, 3 ref.

Descriptors: *Open channel flow, *Meanders, *Vortices, *Hydraulic models, *Photography, Instrumentation, Flumes, Lighting, Cameras, Model studies, Turbulent flow, Streamflow, Tracers, Tracking techniques.
Identifiers: Spiral flow.

A method is described for observing motions in two laboratory open channels of 180 deg bends of different curvature and width. The secondary currents responsible for forming the spiral motion were made visible and recorded by a photographic technique. Photographs of the secondary currents were taken using exposures at two cross-sections, and at two depths of flow (h=7.6 cm and 3.75 cm). The patterns of secondary flow at these cross-sections were recorded by photographing, in a direction perpendicular to the cross-section concerned, illuminated tracer particles. Two tracer agents were used: in laminar flow, a plastic powder, specific gravity, 0.96; particle size range, 0.1-0.2 mm; in turbulent flow, droplets of a mixture of nitrobenzene, olive oil and water. The study concludes that when the aspect ratio of the flow (b/h) increases, the strength of secondary currents, as represented by the flow deviation from the circumferential direction, decreases. (Knapp-USGS)
W70-04553

TRANSFERRING STREAMFLOW CHARACTERISTICS,
Geological Survey, Washington, D.C.
H. C. Riggs.
ASCE Meeting Preprint 1093, American Society Civil Engineers Meeting, Jan 26-30, 1970, Memphis, Tennessee. 18 p, 5 fig, 1 tab, 7 ref.

Descriptors: *Streamflow forecasting, *Statistical methods, Regression analysis, Rainfall-runoff relationships, Hydrologic data, Data processing, Hydrographs, Water measurement, Forecasting, Estimating, Sampling.
Identifiers: Streamflow characteristics transfer.

The design of water-resource developments and protection works requires estimates of the statistical characteristics of streamflows such as flood peaks and annual minimum flows of selected recurrence intervals, and annual and seasonal means and their variabilities. At gaged sites, these characteristics may be obtained directly from the streamflow records. At ungaged sites, to transfer natural-flow data, a general procedure called regionalization uses data from many gaged sites in a region to produce a relation applicable to any ungaged site in that region. Other methods transfer information from one gaged site to a specific ungaged site at which a small amount of information has been collected. Four general procedures for transferring flow characteristics are described. (Knapp-USGS)
W70-04554

ACCURACY OF STREAMFLOW CHARACTERISTICS,
Geological Survey, Washington, D.C.
Clayton H. Hardison.
Available for sale from Superintendent of Documents U S Government Printing Office, Washington, D C 20402-Price $3.75. Geological Survey Research 1969, Professional Paper 650-D, p D210-D214, 1969. 5 p, 3 fig, 4 tab, 5 ref.

Descriptors: *Streamflow forecasting, *Analytical techniques, *Statistical methods, *Data processing, Correlation analysis, Regression analysis, Sampling, Data collections, Estimating.

Identifiers: Streamflow characteristics, Data accuracy, Error analysis.

Streamflow information, which is one of the end products of the Water Resources Division of the U. S. Geological Survey, may be obtained directly from a streamflow record or may be derived from base data by analytical methods. In either case, accuracy goals for the information obtained are needed to test the adequacy of the information and to design the data-collection system upon which the information is based. It is proposed that the accuracy goal for each streamflow characteristic be set equivalent to the accuracy with which that characteristic could be estimated from an observed record of some stipulated length. Curves and tables are presented in this paper to aid in setting such goals. (Knapp-USGS)
W70-04564

RELATION OF THE MANNING COEFFICIENT TO MEASURED BED ROUGHNESS IN STABLE NATURAL CHANNELS,
Geological Survey, Menlo Park, Calif.
J. T. Limerinos.
Available for sale from Superintendent of Documents U S Government Printing Office, Washington, D C 20402 Price $3.75. Geological Survey Research 1969, Professional Paper 650-D, p D215-D221, 1969. 7 p, 1 fig, 3 tab, 6 ref.

Descriptors: *Roughness (Hydraulic), *Mannings equation, Alluvial channels, Particle size, Particle shape, Statistical methods, Regression analysis, Roughness coefficient, Flow resistance.
Identifiers: Particle smoothness (Hydraulic).

An objective method of determining basic values of the Manning roughness coefficient was studied in channels with coarse bed material. Data were obtained from 50 current-meter measurements of discharge and appropriate field surveys at 11 sites on California streams. Characteristic bed-particle sizes, including the 16-, 50-, and 84-percentile sizes, for both minimum and intermediate axes were used to find the best relation between the roughness parameter and relative smoothness. The relations best fitting the field data were obtained when the characteristic particle size was either the 84-percentile d84 or a weighted composite size dw. Percentage differences for the 50 observed and computed values of n involving either d84 or dw had a standard deviation of about 19%. The form of the derived equations, using d84 or dw, was virtually identical with theoretical equations presented by Chow in 1959 and Vennard in 1961 and with an equation derived from field data by Leopold and Wolman in 1957. ON THE SUBJECT OF A FLOOD PROPAGATION COMPUTATION METHOD (MUSKINGUM METHOD),
Societe Grenobloise d'Etude et d'Applications Hydrauliques (France).
J. A. Cunge.
Text also printed in French. Journal of Hydraulic Research, Vol 7, No 2, p 205-230, 1969. 26 p, 5 fig, 5 ref.

Descriptors: *Routing, *Mathematical studies, *Flood routing, *Stage-discharge relations, Computers, Mathematical models, Discharge (Water), Flood forecasting, Hydrology.
Identifiers: Muskingum method, Saint-Venant equations.

The Muskingum flood wave propagation computation method and variants of it are in current use. It is a convenient method as the computer calculations can be rapidly carried out even with a machine of limited capacity. The basic assumption for the method is that the stage/discharge relationship is one-to-one, and strictly applied, this assumption leads to a differential equation whose analytical solution does not allow for wave damping. The Muskingum method, however, gives the attenuation of a wave travelling along a stream. Analysis of the Muskingum formula shows it also to be a finite-difference approximation of another differential equation derived from the Saint-Venant equations by neglecting the inertia terms. There is a solution to this equation which allows for damping of the flood wave. By comparing this differential equation with the Muskingum formula the coefficients of the latter can be determined from the physical river characteristics, but the stage/discharge relationship can then no longer be assumed to remain one-to-one. FLOOD OF AUGUST 1969, BON AIR QUADRANGLE, RICHMOND, VIRGINIA,
Geological Survey, Washington, D.C.
E. M. Miller.
Geological Survey Hydrologic Investigations Atlas HA-409, 1 sheet, 1969. Text, 2 fig, 1 photo, 1 map, 1 tab.

Descriptors: *Floods, *Virginia, *Hurricanes, *Historic flood, Cloudbursts, Peak discharge, Rain, Rain water, River flow, Storm runoff, Stage-discharge relations.
Identifiers: James River (Va), Richmond (Va).

The approximate areas inundated in and near Richmond, Va., by the flood of August 22, 1969, on the James River are shown on a topographic map. The flood was caused by torrential rains brought by the remnants of Hurricane Camille. The flood of May 1771 is considered the greatest in the James River basin since the settlement of Jamestown in 1607. The August 1969 flood at the Virginia Division of Water Resources gaging station, 0.1 mile upstream from the Huguenot Memorial Bridge (river mile 111.7), reached a stage of 24.95 feet, gage datum, (discharge, 222,000 cfs) and was the highest for the period of record (1935-69). At the U. S. Weather Bureau gaging station at river mile 103.7, the flood reached a stage of 28.6 feet, msl, (29.9 ft at former site of U. S. Weather Bureau gaging station at river mile 104.6), and was the highest since the great flood of 1771. (Knapp-USGS)

BIG BLUE RIVER BASIN.
Nebraska Soil and Water Conservation Commission, Lincoln.

Nebraska State Water Plan Publication No 201, September 1968. 103 p, 21 fig, 22 tab, 13 ref.

Descriptors: *Water resources development, *Groundwater, *Surface waters, *Nebraska, Irrigation water, Recreation, Flood control, Erosion control, Reservoirs, Planning, Hydrogeology, Hydrology, Geology.
Identifiers: Big Blue River basin (Nebr).

The Big Blue River basin of Nebraska has large acreages of deep productive soils, highly variable but generally adequate rainfall, and somewhat erratic streamflow. The major industry in the basin is diversified agriculture and related agriculturally oriented enterprises. This area is predominantly agricultural in nature. Groundwater storage reservoirs are quite extensive in the upper and central parts of the basin. The groundwater table is currently declining in localized areas of high concentration of irrigation wells. The main source of irrigation water has been from groundwater but excessive rates of water level decline in some areas indicate that better water management is needed. The primary needs evidenced in the basin are: flood control in the lower reaches of the streams, stabilization of the groundwater table in the upper and central basin, erosion control throughout the basin, drainage of certain depressional areas in the upper and central basin, stabilization of the economy, and provision of more recreation opportunity, especially water-oriented recreation. BEHAVIOR OF CHANNELS UPSTREAM FROM RESERVOIRS,
Geological Survey, Tucson, Ariz.
Thomas Maddock, Jr.
French resume included. In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 812-823, 1966. 12 p, 6 fig, 10 ref.

Descriptors: *Alluvial channels, *Reservoirs, *Sedimentation, Sediment transport, Deposition (Sediments), Aggradation, Sediment control, Vegetation effects, Reservoir silting, Channel morphology, Roughness (Hydraulic).
Identifiers: Upstream channels (Reservoirs).

Channel gradients above and below reservoirs, and even check dams have had little study. Recent statistical studies of gradients above check dams have been inconclusive. It is shown that the important factor yet unconsidered is the hydraulic relative roughness of the channel before and after the construction of the impeding structure. Since, for the same purely alluvial channel, roughness of an aggrading stream is less than that for a 'normal' stream, the gradients above dams are usually less than the natural gradient of a stream. Growth of vegetation introduces a complicating factor into the behavior of channels in alluvium. Sediment deposits behind dams are likely places for heavy vegetative growth. This may result in the deposit of unusual amounts of fine grained sediment and an increase in the stream gradient. Thus, the final gradient of a channel upstream from an obstruction may be largely dependent on the character of the vegetation growing on the newly laid deposits of sediment. (Knapp-USGS)

Identifiers: *Brazil.

Water storage in tens of thousands of small reservoirs in the Brazilian north-eastern region is estimated using a sample of 200 reservoirs, all physical characteristics of which are known. It is possible to establish relations to eliminate the pool depth and thalweg form factors. Then the storage capacities can be calculated from the pool surface and drainage basin length, both measured on maps. On the total volume, the error is not expected to exceed 25%. (Knapp-USGS)

ESTIMATE OF UNDERFLOW IN THE BIOBRARA RIVER BASIN ACROSS THE WYOMING-NEBRASKA STATE LINE,
Geological Survey, Lincoln, Nebr. Water Resources Div.
H. M. Babcock, and C. F. Keech.
Geological Survey Open-file report, May 1969 (revised). 15 p, 2 fig, 1 plate, 3 tab.

Descriptors: *Groundwater movement, Underflow, *Wyoming, *Nebraska, Groundwater basins, Water resources development, Water yield, Discharge (Water).
Identifiers: Niobrara River basin (Wyo-Neb).

Underflow at the Wyoming-Nebraska State line was estimated by applying Darcy's law to measured permeabilities and water levels, and by water budget methods. The coefficient of transmissibility of the Arikaree Group along the Wyoming-Nebraska State line is estimated to be between 15,000 and 30,000 gpd per foot. The underflow is estimated to be between about 5,000,000 and 8,000,000 gpd. Of the factors used in determining the amount of underflow, the largest probable error lies in the determination of the coefficient of permeability. (Knapp-USGS)

SPRINGS IN THE OZARK REGION, NORTHEASTERN OKLAHOMA,
Geological Survey, Oklahoma City, Okla. Water Resources Div.
Roy H. Bingham.
Oklahoma Geology Notes, Vol 29, No 6, Oklahoma Geological Survey, p 135-145, December 1969. 11 p, 7 fig, 3 tab, 4 ref.

Descriptors: *Springs, *Oklahoma, Karst, Recharge, Discharge (Water), Water yield, Water quality, Hydrogeology, Hydrologic data, Runoff, Aquifers.
Identifiers: Ozark Region (Okla).

Springs are a large potential source of good quality water in northeastern Oklahoma. Discharge measurements during September and October 1968 show that 26 of the largest springs were flowing about 21 mgd, an amount sufficient to furnish domestic supplies to a population of about 200,000. Data on the springs were collected during a reconnaissance of the water resources in the Tulsa quadrangle. The existence and location of springs in this regions depend upon the position of the water table, the topography of the area, and the lithology and structure of the geologic formations. The only geologic features described are those that are necessary to provide an understanding of the physical framework through which groundwater moves. (Knapp-USGS)

VISCO-ELASTIC THEORY OF THE DEFORMATION OF A CONFINED AQUIFER,
Kyoto Univ. (Japan). Disasters Prevention Research Inst.
Yoshiaki Fukuo.
Bulletin of the Disaster Prevention Research Institute, Vol 19, Part 1, Paper 150, p 1-13, August 1969. 13 p, 4 fig, 6 ref.

Descriptors: *Aquifers, *Groundwater movement, *Elastic deformation, *Elasticity (Mechanical), Rock properties, Aquicludes, Artesian wells, Water levels, Confined water.
Identifiers: Confined aquifers, Aquifer elasticity, Pore water.

A dynamic theory was derived for the deformation of a granular solid saturated with a liquid, assuming that the liquid filling up the pore space is a Newtonian viscous fluid and that the skeleton constituted by solid particles is a linear visco-elastic solid. The theory consists of the three fundamental equations, that is, the equations of motion of the liquid and the skeleton and the equation of continuity between the particles and the liquid. If the particle and liquid are taken to be incompressible

and the deformation of soil takes place on a quasi-static process, these equations are accepted as the theory of three-dimensional consolidation, including Terzaghi's well-known equation as a special case, and are also recognized as the basic equations of motion of confined groundwater in a visco-elastic aquifer. A theoretical example shows the rheological deformation of an infinite confined aquifer with uniform thickness caused by pumping water at a constant rate. (Knapp-USGS)

AVAILABILITY OF GROUNDWATER FOR IRRIGATION IN CHEYENNE COUNTY, NEBRASKA,
Nebraska Univ., Lincoln. Conservation and Survey Div.
Frank A. Smith.
Nebraska University Conservation and Survey Division Report, April 1969. 10 p, 1 fig, 1 tab, append.

Descriptors: *Water resources, *Groundwater, *Irrigation water, *Nebraska, Alluvium, Hydrogeology, Water yield, Water levels, Water table, Transmissivity, Water wells, Aquifers.
Identifiers: Cheyenne County (Nebr).

Three different stratigraphic units are sources of water supplies in Cheyenne County, Nebraska. Most wells in valleys tap either alluvial deposits of Quaternary age or the underlying Brule Formation of Tertiary age; a few may tap the Ogallala Formation, also of Tertiary age but younger than the Brule. Most wells on the tablelands derive water from the Ogallala Formation alone. Generally, the alluvial deposits are mostly fine grained or thin and capable of yielding only small supplies to wells. Plans for development of irrigation supplies should take into consideration the fact that the groundwater resources will last only 30, 50, 100 years or more, depending on the intensity of the development. Well data, including drillers' logs, are tabulated. Maps, scaled about 2 miles per inch, show potential well yield, top of the Brule Formation, and the configuration and depth of the water table. (Knapp-USGS)

HYDRAULIC TESTING AND SAMPLING OF USBM-AEC COLORADO CORE HOLE 3, RIO BLANCO COUNTY, COLORADO,
Geological Survey, Denver, Colo.
E. H. Cordes.
Geological Survey Open-file Report, December 1969. 42 p, 12 fig, 8 ref.

Descriptors: *Hydrogeology, *Oil shale, *Colorado, *Nuclear explosions, Permeability, Transmissivity, Water pollution sources, On-site tests, Geologic investigations, Water wells, Hydrologic data, Aquifers.
Identifiers: Project bronco, Pumping tests, Aquifer testing.

On November 21, 1967, the U. S. Geological Survey completed the hydraulic testing and sampling of USBM-AEC Colorado Core Hole 3 in Rio Blanco County, Colorado. This hole was drilled to explore the site for Project Bronco, a Plowshare experiment to study the feasibility of in situ retorting of oil shale after breaking the rock with a nuclear explosion. The hydraulic tests indicate the existence of a highly permeable water-bearing zone in the upper and middle parts of the Parachute Creek Member of the Green River Formation. The zone yielded water in excess of 2,700 cubic meters per day. Natural groundwater circulation dissolved the salt deposits from a part of the oil shale, leaving a highly permeable zone. Underlying rocks are comparatively impermeable, and yielded less than 16 cubic meters per day of highly saline fluid. Potential flooding of a rubble chimney is an important consideration for project feasibility and safety. A first approximation of the magnitude of flooding was calculated from the test data. (Knapp-USGS)

RECONNAISSANCE OF THE WATER RESOURCES OF THE FORT SMITH QUADRANGLE, EAST-CENTRAL OKLAHOMA,
Geological Survey, Oklahoma City, Okla.
Melvin V. Marcher.
Oklahoma Geological Survey Hydrologic Atlas 1, 1969. 4 sheets, text, 6 fig, 5 map, 3 tab, 30 ref.

Descriptors: *Water resources, *Groundwater, *Surface waters, *Oklahoma, Water supply, Water wells, Water yield, Aquifers, Geology, Water quality, Streamflow, Precipitation (Atmospheric).
Identifiers: Fort Smith (Okla).

The geology and water resources of the Fort Smith quadrangle, Oklahoma are shown by a 4-sheet hydrological atlas consisting of a geological map, a groundwater availability map, a groundwater quality map, a map showing distribution of precipitation, hydrographs, tabulated data, and descriptive text. In some parts of the Fort Smith quadrangle, wells readily yield several hundred gallons of water per minute suitable for most purposes, whereas in other parts, supplies of water sufficient for daily household use are difficult to obtain and much of this water is of poor quality. Differences in well yield and water quality are controlled mainly by the type of rock in which a well is completed. In general, alluvium is the most favorable type of rock for large well yields, followed by terrace deposits in local areas and then, in order of decreasing favorability, weathered chert, limestone, sandstone, and siltstone, with shale the least favorable. In addition to rock type, geologic structure also affects the occurrence of groundwater, particularly in the northeastern part of the area where springs and some of the wells of larger yield apparently obtain water from rocks broken by faulting. Minor streams in the area go dry or nearly dry almost every year. Alluvium yields groundwater of the best quality and shale to poorest, whereas other rock types yield water with a quality somewhere between. Groundwater that has been in contact with coal beds is usually highly mineralized and, in some places, unfit to drink. Coal mining and oil- and gas-field development may adversely affect the water quality locally. (Knapp-USGS)

EFFECT OF PULSE RECHARGE ON THE ZONE OF DIFFUSION IN THE BISCAYNE AQUIFER,
Geological Survey, Miami, Fla. Water Resources Div.
F. A. Kohout, and Howard Klein.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 252-270, 1967. 19 p, 14 fig, 8 ref.

Descriptors: *Recharge, *Saline water intrusion, *Groundwater movement, *Aquifers, *Florida, Water quality, Water yield, Discharge (Water), Hydraulic gradient, Water storage, Permiability, Transmissivity, Infiltration.
Identifiers: Miami (Fla), Biscayne aquifer.

In the Biscayne aquifer of the Miami area, Florida, the salt front is dynamically stable at a position as much as 8 miles seaward of that computed according to the Ghyben-Herzberg principle. When the fresh-water head is low, sea water flows inland into the deep part of the aquifer, moves upward, and flows back to the sea through the upper part. The cycle limits the extent to which sea water invades the aquifer. During periods of heavy rainfall large quantities of fresh water are stored below sea level, while deep saline water is driven seaward under steep seaward hydraulic gradient. The effects of these heavy pulses of recharge are demonstrated by biweekly mappings of the isochlor pattern after a 13-inch rainfall. The flow diagrams show that forceful expulsion of salt water after heavy rains results in more efficient recharge than discharge because fresh water is injected into storage throughout the full aquifer thickness, whereas during the subsequent saline intrusion, fresh water is discharged through only about 1/3 of the aquifer thickness. A MATHEMATICAL MODEL OF AN EXISTING MUNICIPAL WELL FIELD,
Oklahoma State Univ., Stillwater.
Richard N. DeVries.
Pap, 1969 Nat Water Well Exposition, Sept-Oct, 1969. 30 p, 3 fig, 15 tab, 6 ref, 4 append.

Descriptors: *Water wells, *Wells, *Mathematical models, Permeability, Operations, *Municipal water, Nebraska, Theis equation, *Model studies, Computer programming, Drawdown, Groundwater recharge, Groundwater flow, Storage coefficient, Pumping, Groundwater mining, *Aquifers.
Identifiers: *Hydrologic models, Groundwater depletion, Pumping tests, Groundwater hydrology, Platte River (Nebr).

Increased irrigation demands on water from the Platte River in central Nebraska are causing a depletion in the flow passing Lincoln's municipal well field at Ashland, Nebr. A study was made for the US Army Engineers, Omaha District, on the future harmful effects of the depletion. A mathematical model using the Theis nonequilibrium equation was formulated. Drawdown computations were performed using a computer. Recharging image wells represented the physical boundary of the aquifer. Drawdowns in selected wells were calculated using the method of superposition by including real wells and image wells. Values for permeability and the storage coefficient were computed from field pumping test data. Three model runs were made. The well field was operable at high rates for periods of greater than 30 days with recharge from the river. Previous studies indicated that the river was the source of most water produced from the wells. The well field can draw on the groundwater reservoir for much longer periods than had been assumed. GEOLOGY AND GROUNDWATER RESOURCES OF LINN COUNTY, KANSAS,
Kansas State Geological Survey, Lawrence.
William J. Seevers.
Kansas Geological Survey Bulletin 193, November 1969. 65 p, 9 fig, 1 plate, 4 tab, 66 ref.

Descriptors: *Water resources, *Groundwater, *Geology, *Kansas, Aquifers, Data collections, Hydrologic data, Hydrogeology, Water wells, Water yield, Water levels, Water quality.
Identifiers: Linn County (Kansas).

Linn County is located along the Kansas-Missouri boundary in east-central Kansas and is a nearly square area of about 605 square miles. Only very small quantities of groundwater are obtained from Pennsylvanian rocks in Linn County. Yields rarely exceed 1 gallon per minute and are normally barely sufficient for domestic purposes. Limestones are the most productive aquifers, and limestones of the lower part of the Kansas City Group are the best of the bedrock aquifers. Groundwater below a depth of about 100 feet in this area is normally too highly mineralized for use. Large quantities (30 to 100 gpm) of good quality water are obtained from properly constructed and developed wells in Il-

linoisan and Wisconsinan valley-fill deposits, mainly from thin gravel deposits near the base. (Knapp-USGS)

THE GROUNDWATER HYDROLOGY OF THE LINCOLNSHIRE LIMESTONE,
Water Resources Board, Reading (England). Groundwater Div.
R. A. Downing, and B. P. J. Williams.
Water Resources Board Publication No 9, Reading, England, 1969. 160 p, 44 fig, 4 plate, 19 tab, 58 ref.

Descriptors: *Hydrogeology, *Aquifers, *Water supply, *Limestones, Hydrology, Transmissivity, Water resources development, Groundwater, Water wells, Artesian wells, Geology, Recharge, Artificial recharge.
Identifiers: Lincolnshire Limestone (England).

The Lincolnshire Limestone, forming part of the Jurassic Inferior Oolite Series of England, is a hard compact limestone incorporating oolitic and pisolitic limestones (which are commonly shelly), calcite mudstones, and locally developed sandy limestones. Both vertical and lateral variations in lithology are ubiquitous. The Limestone thins to the north and south of the Grantham area where the maximum thickness is about 130 ft (40 m). Groundwater flow is mainly through fissures. In South Lincolnshire the water in the Limestone is confined under pressure over a considerable area, and overflowing conditions exist in the low lying ground forming the Fens. High transmissibilities may be due to the solvent action of groundwater moving relatively freely through the aquifer during the Pleistocene period to discharge points in deep channels (now infilled with drift) centered on the Wash. Groundwater in the outcrop zone is of the calcium bicarbonate type, changing gradually to a sodium bicarbonate type and ultimately to a sodium chloride type in a downdip direction. The Limestone is developed extensively for water supply in South Lincolnshire where it is confined by overlying Jurassic strata. The total theoretical resources of the Limestone are estimated to be about 69 mgd; abstraction in 1965 amounted to some 22 mgd. (Knapp-USGS)

GEOLOGICAL SUBSIDENCE,
Sullivan S. Marsden, Jr., and Stanley N. Davis.
Scientific American, Vol 217, No 6, p 93-100, June 1967.

Descriptors: *Land subsidence, *Injection wells, *Pumping, *Irrigation, *Oil reservoirs, Oil wells, Natural gas, Semiarid climates, Groundwater, California, Subsidence, Damages, Withdrawal, Compaction, Rocks, Structural geology, Instrumentation, Logging (Recording).
Identifiers: *San Joaquin Valley, (Calif).

The pumping of oil, gas or water from the ground often causes the overlying land to sink as porous soil compacts. This phenomenon, known as geological subsidence, was first noted at oil fields near Galveston, Texas, and Long Beach, California. These areas of subsidence are relatively small, however, when compared to the San Joaquin Valley region of California. Sinking has affected areas totalling 2500 square miles there. This is the result of forty years of intensive groundwater pumping for irrigation purposes. In some places the ground is subsiding at the rate of a foot a year and the land is more than 20 feet below its former level. The situation is aggravated by the fact that approximately 20% of all U.S. well water pumping occurs in the San Joaquin Valley. In oil and gas fields the water injection technique is used to prevent soil settling. Further research and investigation is necessary to find methods applicable to water removal areas. (Carr-Arizona)

2G. Water in Soils

FIELD MEASUREMENT OF SATURATED HYDRAULIC CONDUCTIVITY IN INITIALLY UNSATURATED SOIL,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
Herman Bouwer.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 243-251, 1967. 9 p, 3 fig, 12 ref.

Descriptors: *Infiltration, *Measurement, *Soil water movement, *Artificial recharge, *Water spreading, Moisture content, Soil moisture, Hydraulic conductivity, Sorption, Analog models, Model studies, Mathematical models, Hydraulic gradient, Permeameters, Piezometers.
Identifiers: Field hydraulic conductivity tests.

Recent developments for measuring essentially vertical hydraulic conductivity, K, in the zone between soil surface and the water table are discussed. Seepage meters are suitable for measuring K of bottom material (including impedance of clogged surfaces) and local infiltration rates and gradients in spreading basins. A newly developed permeameter-type device enables relatively rapid field measurement of K and the negative soil-water pressure whereby K undergoes its first reduction. The method is applicable to surface and subsurface soil layers and data are obtained for sorption as well as for desorption. Field experiences with the double-tube method are summarized and certain desirable design and operational features are presented. Relatively deep K-measurements can be made by determining infiltration rates and gradients at the bottom of auger holes and wells. Fast-reaching piezometers which enable pressure measurement shortly after insertion were developed for this purpose. A brief discussion is given of how the K-data obtained can be used in analytical, analog, or digital models for predicting total flow systems below spreading basins, including infiltration rates, or transmission losses from ephemeral streams. WATER TRANSFER FROM SOIL TO THE ATMOSPHERE AS RELATED TO CLIMATE AND SOIL PROPERTIES,
Texas A and M Univ., College Station. Water Resources Inst.
Charles W. Wendt.
Available from the Clearinghouse as PB-190 268, $3.00 in paper copy, $0.65 in microfiche. Technical Report No 24, Water Resources Institute, Texas A and M University, February 1970. 88 p, 3 tab, 40 fig, 32 ref. OWRR Project A-006-TEX.

Descriptors: *Evaporation, *Soil, *Soil water, *Lysimeters, Vapor diffusion, Unsaturated flow, Microclimate, Water balance, Energy balance.

Lysimeters of 'natural' soil cores were constructed for field study of evaporation. A total of 9 lysimeters were constructed which were designed for either visual or recorded readout of data. Either the combination method of van Bavel or the Bowen Ratio will provide a fair estimate of evaporation from a wet soil surface in the area. In general, the combination method tends to overestimate while the Bowen Ratio tends to underestimate evaporation. This is due to the fact that the combination method places a strong emphasis on this parameter. The conductivity of the Olton loam soil is very low at fairly low soil water pressures corresponding to high contents. This is an asset in preventing evaporation losses, but may be deterimental to crop production in that the crops need to develop extensive root systems to use the stored soil moisture. Evaporation within a cotton crop canopy following rains is related to the net radiation reaching the soil surface. After the surface dries, the moisture content of the soil surface is the limiting parameter. Crude soil applied to the wet soil surfaces of the lysimeters following rains suppressed evaporation immediately following the rains.

2H. Lakes

AN ECOLOGICAL HISTORY OF THE LAKE VICTORIA BASIN,
Duke Univ., Durham, N. C. Dept. of Zoology.
Robert L. Kendall.
Ecological Monographs, Vol 39, No 2, p 121-176, Spring 1969. 56 p, 18 fig, 5 tab, 167 ref, append.

Descriptors: *Ecology, *Lakes, *Paleoclimatology, Quaternary period, Paleohydrology, Paleolimnology, Limnology, Climatology, Vegetation effects, Fish, Water quality.
Identifiers: Lake Victoris (East Africa).

The ecological history of Lake Victoria, east Africa, was studied using historical, sedimentary, chemical, fossil, and pollen data. During the last 12,000 years the overall sedimentation rate has been essentially constant. Lake Victoria was without an outlet from before 14,500 B.P. until about 12,000 B.P. During this time the lake was chemically more concentrated than it is today, and carbonate minerals were precipitated. From 12,000 to 10,000 B.P. the lake probably had an outlet. For a short period around 10,000 B.P. the lake again became closed. Since that time it has drained northward via the Nile River. Changes in forest vegetation are best explained by changes in rainfall, but during the last 3,000 years human forest clearance has interfered. The climatic changes inferred for the northern Victoria basin--dry from 14,500 to 12,000 B.P., moderately wet from 12,500 to 10,500 B.P., moderately dry from 10,500 to 9,500 B.P., wet from 9,500 to 6,500 B.P., and slightly drier or with a more seasonal rainfall after 6,500 B.P.--correlate very well with those already established for montane and rift valley location in east Africa. The greater chemical concentration of Victoria during part of its history may have forced the fish toward the more dilute tributaries, segregating the populations. (Knapp-USGS)

HISTORY OF LAKES ON THE YOUNG-GLACIAL AREAS OF THE NORTH-EASTERN POLAND,
Warsaw Univ. (Poland). Dept. of Physical Geography.
Jadwiga Stasiak.
In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 847-851, 1966. 5 p, 2 fig, 11 ref.

Descriptors: *Lakes, *Lake stages, *Pleistocene epoch, *Paleolimnology, Glacial drift, Ponds, Geomorphology, Limnology, Bogs, Lake basins, Lake beds.
Identifiers: *Poland.

Areas of Poland covered by the last glacier are rich in lakes which were established by melting of blocks of dead, buried ice. The lake age depends upon the thickness of the material covering the ice. The majority of lakes began to appear already in Allerod as shallow, extensive flood waters. In the Holocene, Preboreal and Boreal periods occurred the further formation and deepening of lakes under the influence of ice melting. Some lakes in outwash areas where the thickness of outwash material is considerable, appear only in climatic optima. In the Holocene, there occurred considerable fluctuations of the groundwater table resulting from climatic variations. The fluctuations caused the decay of a great number of smaller basins. (Knapp-USGS)
W70-04754

CHANGES OF THE WATER LEVEL OF LAKE BALATON FROM THE NEOLITHIC AGE UP TO THE PRESENT TIME,
Research Inst. for Water Resources Development, Budapest (Hungary).
L. Bendefy.
In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 852-864, 1966. 13 p, 7 fig, 10 ref.

Descriptors: *Water levels, *Lakes, *Dams, *Spillways, *Regulation, Water level fluctuations, Reservoir operation, Geomorphology, High water mark, Low water mark.
Identifiers: *Lake Balaton (Hungary).

Geomorphology, archeologic evidence, and measurements of past water heights were used with historical records to compile a history of water levels of Lake Balaton, Hungary. The depth in preneolithic times was 106-107 m above Adriatic sea level. Neolithic people built a dam to raise the level to 109 m for defensive purposes. The Romans build a sluice to control the level at 104.5 m. Since that time, the level has been maintained at heights between 107 and 112 m by Hungarians, with high levels in response to invasions and threats of invasions, and low levels for more exposure of farm lands in times of peace. The present level is controlled by a concrete lock at 104.5-105.8 m. (Knapp-USGS)
W70-04755

SOME METHODOLOGICAL PROBLEMS OF INVENTORIES ON LAKES,
Research Inst. for Water Resources Development, Budapest (Hungary).
K. Szesztay.
In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 894-905, 1966. 12 p, 8 fig, 3 tab, 2 ref.

Descriptors: *Lakes, *Surveys, *Statistical methods, Hydrologic data, Hydrologic budget, Data collections, Water resources development, Water management (Applied), Water quality, Water supply, Limnology.
Identifiers: Hungary.

Considering national and international aspects of lake water resources, two kinds of inventories are required: (1) a general survey on all lakes larger than a chosen lower limit, using morphometrical data that can be determined mostly from general geographical maps; (2) an additional survey limited to hydrologically well-studied lakes, containing all basic hydrological data. Results of a detailed national inventory in Hungary show that the number of mapped lakes varies with the chosen lower limit according to a well-defined statistical pattern. As very tentative values for reasonable lower extension limits, 0.5 to 5 hectares can be recommended in case of detailed local surveys, 10 to 50 hectares in case of general countrywide surveys, and 100 to 200 sq km in case of continental or global surveys. The use of the central files comprising inventory results can be facilitated by preparing indexes, maps and diagrams following the viewpoints of various possible application fields. Comparing inventory results with climatological and geomorphological data, general conclusions can be drawn on water balance and stage-regime conditions. (Knapp-USGS)
W70-04757

ON WATER BUDGET LAKE CLASSIFICATION,
Leningrad State Univ. (USSR). Limnology Lab.
B. B. Bogoslovsky.
In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 910-917, 1966. 8 p, 2 fig, 1 tab, 13 ref.

Descriptors: *Limnology, *Lakes, *Surveys, *Classification, Inflow, Streamflow, Water levels, Water supply, Water resources development, Water level fluctuations, Hydrologic budget.
Identifiers: *USSR, Lake classification.

A lake classification is proposed based on the correlation of water budget components. In the USSR, two groups of lakes are based on the correlation of the components of the expenditure part of water budget: (1) 'stokovye' - with outflow predominance; and (2) 'isparjayuschie' - with evaporation predominance. Within every group the lakes are subdivided into types according to the character of the income budget part: 'pritochny' - with the inflow predominance from rivers: 'dohzdevoj' - with atmospheric precipitation predominance to the lake surface and 'neitralny' - with equal quantity of water coming from rivers and atmospheric precipitation. The lake designation in the classification includes the name of the group and the type. Areal distribution of lake types reveals a geographical zonality, both latitudinal and vertical. The lakes of the first type are typical of the zones with high moisture, the lakes of the second type, of arid zones. Water budgets of the lakes with a great drainage basin and a small surface show predominance of inflow and outflow from the lake. The lakes with a large surface and a small drainage basin differ by the predominance of evaporation and atmospheric precipitation. On the basis of the proposed classification a territorial division of lakes of the USSR was performed. (Knapp-USGS)
W70-04758

THE ADAPTATION OF PLANKTON ALGAE. III. WITH SPECIAL CONSIDERATION OF THE IMPORTANCE IN NATURE,
Royal Danish School of Pharmacy, Copenhagen. Dept. of Botany.
E. Steemann Nielsen, and Erik G. Jorgensen.
Physiologia Plantarum, Vol 21, No 3, p 647-654, 1968. 2 tab, 20 ref.

Descriptors: *Plankton, *Algae, Light intensity, Temperature, Primary productivity, Surfaces, Arctic, Enzymes, Chlorophyll, Photosynthesis, Chlorella, Grazing, Zooplankton, Diatoms, Respiration, Pigments, Oceans, Organic matter, Diurnal, Latitudinal studies.
Identifiers: Photooxidation, Chlorella vulgaris, Chlorella vulgaris (Columbia), Chlorella pyrenoidosa, Chlorella saccharophila, Chlorella ellipsoidea, Chlorella luteoviridis, Skeletonema costatum, Physiological adjustment, Asterionella formosa, Cyclotella Meneghiniana, Photic zone, Helsingor (Denmark), Salino-cline.

Adaptation (physiological adjustmant) of plankton algae, in natural states, to different light intensities and temperatures is described. Although different species vary in extent of adaptation, they all adapt to some degree, and adaptation is significant for plankton populations at all depths. Shade adaptation of algae in the lower part of the photic zone is often of minor importance to the integral primary production per unit of surface, except on occasions when the bulk of the algae is found in this lower part. It is shown that the I-sub-k (a light intensity defining onset of light-saturated photosynthesis) of surface plankton during summer in the Arctic is high despite low temperatures due to increase of the enzyme quantities per cell. Daily fluctuations in I-sub-k are partially due to photooxidation and partially because the periods for the production of chlorophyll and photosynthetic enzymes are mutually displaced. Despite daily fluctuations in I-sub-k, the difference between 'sun' and 'shade' phytoplankton is distinct. The diurnal variation in photosynthetic activity of phytoplankton may take place especially at low latitudes, and near the surface; and to some extent at higher latitudes, and in lower photic zone. (Jones-Wisconsin)

EUTROPHICATION TESTING PROGRAM FOR MINNESOTA'S 'SKY BLUE WATERS',
Schoell and Madson, Inc., Hopkins, Minn.
James R. Orr.
Water and Sewage Works, Vol 115, No 3, p 97-101, 1968. 2 fig, 2 tab, 10 ref.

Descriptors: *Eutrophication, *Minnesota, Recreation, Sewage disposal, Water pollution, Pollution abatement, Coliforms, Water quality, Phosphorus, Nitrogen, Flow, Chemical analysis, Nutrients, Effluents, Algae, Weeds, Carbon dioxide, Vitamins, Nitrates, Inorganic compounds, Surface runoff, Underflow, Precipitation (Atmospheric), Drainage, Fertilizers, Farm wastes, Soil erosion, Frozen ground.
Identifiers: Lake Minnetonka (Minn), Minneapolis-St Paul (Minn).

The greatest source of nutrients to Lake Minnetonka, one of Minnesota's best known lakes, is sewage treatment plant effluent. A major part of the problem would be solved by removing nutrients from effluents or suppressing sewage effluent discharge. Loss of large quantities of wastewater outside the watershed could aggravate the problem of maintaining lake level. Another approach may be control of excessive weed and algae production by chemical treatment or mechanical harvesting, however, continued use of algicides may eventually have a toxic effect on fish and other aquatic life; mechanical harvesting is impractical. Advanced waste treatment of sewage discharged to lake, with emphasis on removal of phosphorus should be considered. Miscellaneous nutrient sources, other than sewage plant effluent, represent approximately 2/3 total nitrogen and approximately 1/5 total phosphorus inflow. Watershed dwellers can minimize these sources by preventing decaying vegetation being washed into the lake by rainfall, discontinuing commercial and manure fertilizer usage, and practicing soil erosion control. Municipalities can assist by keeping public lands clean, locating waste dumps to avert drainage into the lake, eliminating soil absorption sewage disposal facilities adjacent to lake, and by publicizing the problem. (Jones-Wisconsin)
W70-04810

SOME OBSERVATIONS OF CURRENTS IN THE HYPOLIMNION OF LAKE MENDOTA,
Wisconsin Univ., Madison. Dept. of Meteorology.
Alison Lathbury, Reid Bryson, and Bernhard Lettau.
Limnology and Oceanography, Vol 5, No 4, p 409-413, 1960. 3 fig, 1 tab, 3 ref.

Descriptors: *Lakes, *Currents (Water), *Hypolimnion, Wisconsin, Thermal stratification, Seiches, Turbulence, Statistical analysis, Hydrography.
Identifiers: *Physical limnology, *Lake Mendota (Wis), 'Free drag' method, Internal seiches, 'Surface' seiches, Hypolimnetic currents, Surface currents, Hydrokinetics.

Data are presented regarding some 2000 current measurements made by 'free drag' method during a ten year period in Lake Mendota, Wisconsin. Frequency distributions of current velocities are presented for 8 depths from entire lake, but predominantly from southwestern portion. Currents at 2-meter depth are anomalous in that their mean and modal velocity exceeds expected values, and that frequency of currents in interval, 0-0.99 centimeters/second, is smaller than expected. Data suggest operation of influences other than usual wind drift mechanism, possibly a larger than expected role for seiche circulation. Deep water currents, particularly in medium-sized stratified lakes, have been thought to result from internal seiches. Seiches in Lake Mendota typically have range of 2-4 millimeters; amplitude, 1-2 millimeters; period, 25-26 minutes; and induced currents, 0.1 centimeter/second at node. Observations of hypolimnetic currents, integrated over 24 hours to include numerous seiche periods, indicate existence of steady motion below thermocline, which are independent of seiches. Best interpretation regards hypolimnetic currents in Lake Mendota as quasi-steady with superimposed seiche-induced variations. Turbulence, also, will not explain observed currents, but problem remains of distinguishing between magnitude of such currents due to thermally induced pressure gradients, and that due directly to wind. (Eichhorn-Wisconsin)

PHOTOSYNTHETIC BEHAVIOUR IN STRATIFIED AND UNSTRATIFIED LAKE POPULATIONS OF A PLANKTONIC DIATOM,
Freshwater Biological Association, Ambleside (England).
J. F. Talling.
Journal of Ecology, Vol 54, p 99-127, 1966. 11 fig, 70 ref.

Descriptors: *Photosynthesis, *Plankton, *Aquatic life, Lakes, Density stratification, Light penetration, Temperature, Depth, Light, Photoperiodism, Oxygen, Aquatic population, Pigments.
Identifiers: *Carotenoids, Chlorophyll a, Photosynthetic mechanism, Photosynthetic-depth profiles, Photoxidation, Asterionella formosa, Windermere Basin (England), Blelham Tarn (England).

Gross photosynthesis rates of four populations of Asterionella formosa were determined from exposures in lakes and laboratory during different seasons of the two successive years. Despite differences between the depth of lakes and timing of population maxima, photosynthetic characteristics and pigments remained similar. Vertical distribution of organisms took place rapidly after thermal stratification. Light was the chief factor in the physiological differentiation in a silica-deficient medium. Deeper cells exhibited a decreased carotenoid:chlorophyll a ratio and contracted chromatophores. No diurnal variation in photosynthetic capacity or pigments was observed. The photosynthesis in populations stratified at different depths could be estimated from the distribution of photosynthetic capacity per unit water volume and the depth-profile rates of photosynthesis of homogenous material. (Wilde-Wisconsin)

INTERACTIONS BETWEEN THE RATES OF PRODUCTION OF A FRESHWATER MACROPHYTE AND PHYTOPLANKTON IN A POND,
Hull Unov. (England). Dept. of Botany.
R. Goulder
Oikos, Vol 20, No 2, p 300-309, 1969. 5 fig, 3 tab, 31 ref.

Descriptors: *Phytoplankton, Productivity, Diurnal, Oxygen, Carbon, Light intensity, Ponds.
Identifiers: *Macrophytes, Ceratophyllum demersum, Potamogeton natans, Vertical distribution, Carbon-14, Carbon fixation, Chlorophyll a, Selenium cell, Northeastern England, England.

As determined by carbon-14 analyses, the annual production of phytoplankton in a small pond of northeastern England constituted 1100 grams carbon/ square meter. The gross annual yield of Ceratophyllum demersum in the same basin, as measured with the diurnal oxygen method, was 600 grams carbon/square meter. The high summer macrophyte productivity followed the maximum spring increment of the phytoplankton. Another pond, with a lesser macrophyte density, had a high summer phytoplankton biomass but its annual production of only 500 grams carbon/square meter, was below that of the first basin. The reason for the summer suppression of phytoplankton in the first pond is attributed to greater shading exerted by Ceratophyllum demersum compared with Potamogeton natans. Phytoplankton yield showed a relationship with the vertical distribution of chlorophyll. (Wilde-Wisconsin)

SHORELAND CORRIDOR REGULATIONS TO PROTECT LAKES,
Wisconsin Univ., Madison.
J. H. Beuscher.
Eutrophication: Causes, Consequences, Correctives, Printing and Publishing Office, National Academy of Sciences, Washington, DC, 1969. p 520-527.

Descriptors: *Lakes, *Eutrophication, *Land use, *Shore protection, *Zoning, *Regulation, Water pollution, Aesthetics, Public Health, Wisconsin, Legislation, Riparian rights, Competing uses, Streams, Flood plain zoning, Wetlands, Planning, Urbanization, Inter-agency cooperation, Legal aspects, Political aspects, Water law, Water policy, Local governments, Public rights, Ethics.
Identifiers: *Cultural eutrophication, Multiple use, Environmental quality, Wisconsin Water Resources Act, Shoreland Protection Ordinance, University of Wisconsin, Model legislation, Public education.

Increasing multipurpose use of lake and stream shorelands has raised diverse and complex problems, not only regarding eutrophication abatement, but also in the areas of public health, aesthetics, and land-use ethics. It is unlikely that normal economic forces will solve shoreland problems; patient educational and voluntary action programs coupled with legal controls are vitally required. Legalistically, shoreland zoning and regulation must consider ownership of lake bottoms, and relative merits of private property versus public interest. Consideration of regulatory impact on private development must include: its effect upon market value of owner's land; damaging effect of development upon others; extent of the public interest and whether regulation meets that need. Research results to document such criteria are often lacking, but groups of specialists, operating as a team, can identify 'indicators of danger' and thus establish a basis for regulation. Based on these principles, a model County Shoreland Protection Ordinance has been developed at University of Wisconsin, Madison, which incorporates following features: zonning controls; subdivision controls; sanitation controls, tree-cutting restrictions; controls on filling, grading, and creating artificial waterways. A list of requirements for future success of such programs is included. (See Vol. 3, No. 10, Field 5C, W70-03975). (Eichhorn-Wisconsin)

PRODUCTIVITY OF PHYTOPLANKTON AND QUANTITIES OF ZOOPLANKTON AND BOTTOM FAUNA IN RELATION TO WATER QUALITY OF LAKE ASHTABULA RESERVOIR, NORTH DAKOTA,
North Dakota State Univ., Fargo. Div. of Natural Sciences.
J. J. Peterka.
Available from the Clearinghouse as PB-190 356, $3.00 in paper copy, $0.65 in microfiche. Research Project Technical Completion Report, North Dakota, Feb 1970. OWRR Project A-011-NDAK.

Descriptors: *Water chemistry, Reservoirs, *Phytoplankton, *Zooplankton, Benthic invertebrates, Primary and secondary productivity, Ecology, North Dakota eutrophication, Limnology.
Identifiers: Lake Ashtabula Reservoir.

Lake Ashtabula, a 5,430-acre reservoir in southeastern North Dakota, was found to be a highly productive impoundment. Chemical, physical, and plankton samples were taken in 1967-68; benthic invertebrates in 1967. Largest chemical exchanges occurred from February-June when large water volumes also entered and left the reservoir. Large amounts of phosphates, inorganic nitrogen and total iron entered during March. Phosphates, total iron and total alkalinity were retained in the reservoir from June 1967 to June 1968, whereas sulfates decreased. The order of appearance of maximum numbers of zooplankton was similar in 1967-68 with Cyclopoida first, then Daphnia pulex, Asplanchna, Diaptomus, Daphnia galeata mendotae, Bosmina, Cereodaphnia, Chydorus, and a fall pulse of D. pulex. Chaoborus was found only in 1967; Leptodora in 1968. Daphnia comprised 84% of total zooplankton dry weight standing crop in 1967 and 81% in 1968; copepods 14% in 1967 and 17% in 1968. The average dry weight daily standing crop of D. pulex was 1110 in 1967 and 2851 mg/ (sq m) in 1968; of D. g. mendotae was 294 in 1967 and 7.2 mg/ (sq m) in 1968. Daphnia annual net production averaged 113.1 and 71.3 mg/ (sq m)/sq day in 1967 and 1968, respectively; its calculated turnover time from January-December was 11.8 days for 1967 and 40.0 days for 1968. In both years, plytoplankton at Station 2 included a March-June pulse of largely nannoplankton diatoms, Stephanodiscus spp., and Cyclotella spp., followed by microplankton Stephanodiscus niagarae, Asterionella formosa and Cryptomonas spp. from June-July. Aphanizomenon holsaticum dominated from July-November. In 1967 and 1968, respectively, Aphanizomenon comprised 86.3 and 92.9%, diatoms 13.4 and 2.97%, and other phytoplankters 0.3 and 4.2% of total algal weight from January-December. At Station 2 from January-December 1967 and 1968, the average daily algal weight standing crop was 176.5 and 288.6 g/ (sq m), and average daily gross photosynthesis was 4.10 and 6.75 O2/ (sq m)/day, respectively. From March-November 1968, 1.0 microgram chlorophyll 'a' = 1.0 cu mm algal cells. The correlation coefficient of silicon with loge total diatom numbers from 3 June-20 October 1968 was $r = 0.51$ ($P = 0.05$). The average standing crop of benthic invertebrates at Station 2 from April-August 1967 was 2,483 individuals weighing 10.9 g/ (sq m), with 52% by number and 76% by weight found in the 0-3 m depth zone; 42% by number and 21% by weight in 3-8 m; and 6% by number and 3% by weight in the 8-12 m depth zone.

HISTORY OF THE DEVELOPMENT OF LAKE ISSYK-KUL. (IN FRENCH),
Moscow State Univ. (USSR).
Z. V. Aleuchinskaya, L. G. Bobdarev, and R. D. Zabirov.
In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 841-846, 1966. 6 p, 2 fig, 12 ref.

Descriptors: *Lakes, *Paleolimnology, Geomorphology, Water quality, Depth, Productivity, Ecology, Pleistocene epoch, Lake morphology, Lake stages, Water levels.
Identifiers: *USSR, Lake Issyk-Kul, Paleontology.

The history of the origin and development of Lake Issyk-Kul, one of the largest lakes in the Soviet Union, is described. When solving problems of paleolimnology, geological-geomorphological,

geochemical, paleontological, and isotopic methods were used. The investigations described a complicated history of the Lake Issyk-Kul and repeated fluctuations of its level, mainly due to climatic changes. (Knapp-USGS)

EFFECT OF DROUGHT UPON RATES OF PHOTOSYNTHESIS, RESPIRATION, AND TRANSPIRATION OF SEEDLINGS OF TWO ECOTYPES OF DOUGLAS-FIR,
Oregon State Univ., Corvallis. School of Forestry; and Oregon Agricultural Experiment Station, Corvallis.
J. Zavitkovski, and W. K. Ferrell.
Botanical Gazette, Vol 129, No 4, p 346-350, December 1968. 3 fig, 1 tab, 19 ref. NSF Grant G-9576.

Descriptors: *Drought resistance, *Douglas fir trees, *Respiration, *Transpiration, *Photosynthesis, Turgidity, Droughts, Arid lands, Moisture stress, Plant physiology, Environment, Seeds, Soil moisture, Soil-water-plant relationships, Moisture tension.
Identifiers: *Seedlings.

Douglas-fir seedlings were grown from seed collected at two sites of widely differing habitat. One group of seed was gathered from an area of high precipitation but limited summer rain, the other from a dry area with a prolonged summer drought. Rates of respiration, transpiration, and photosynthesis were determined under variable soil-moisture stress conditions. After 1 atm of stress was reached photosynthetic rates declined sharply. Mesic site seedlings had higher respiration and transpiration rates at both high and low soil moisture tensions. Seedlings from the drier environment had higher rates of photosynthesis at high relative turgidities and lower rates at low relative turgidities than seedlings from the wetter site. Relative turgidity of xerophytic seedlings varied less than that of mesophytic seedlings over a wide range of soil-moisture tensions. It appears that seedlings from the xeric site have adapted to the severe drought conditions of their arid environment. (Carr-Arizona)

DIURNAL VARIATION IN LEAF AND BOLL TEMPERATURES OF IRRIGATED COTTON GROWN UNDER TWO SOIL MOISTURE REGIMES IN A SEMI-ARID CLIMATE,
Commonwealth Scientific and Industrial Research Organization, Griffith (Australia). Irrigation Research Lab.
J. H. Palmer.
Agricultural Meteorology, Vol 4, No 1, p 39-54, January 1967. 7 fig, 2 tab, 20 ref.

Descriptors: *Cotton, *Irrigation effects, *Crop response, *Moisture stress, *Diurnal, Fluctuation, Biorhythms, Plant physiology, Air temperature, Semiarid climates, Soil-water-plant relationships, Thermal stress, Temperature, Leaves, Soil moisture, Furrow irrigation, Canopy, Measurement, Summer, Winter.
Identifiers: *Leaf temperature, *Boll temperature, *Australia, Thermocouples.

Cotton plants under furrow irrigation were studied to determine the effect of withholding irrigation water upon leaf and boll temperature. In all of the experiments the leaf temperature of irrigated plants tended to level off toward the end of the morning, but the temperature of non-irrigated plants continued to increase at the early morning rate. For both moisture regimes, the plants cooled rapidly following midafternoon and were cooler than the ambient air by early evening. In a comparison of irrigated and non-irrigated plants, it appeared that boll temperature is more sensitive than leaf temperature to soil moisture stress. (Carr-Arizona)

2J. Erosion and Sedimentation

SUSPENDED MATTER IN SURFACE WATERS OF THE ATLANTIC CONTINENTAL MARGIN FROM CAPE COD TO THE FLORIDA KEYS,
Woods Hole Oceanographic Institution, Mass; and Williams Coll., Williamstown, Mass. Dept. of Geology.
Frank T. Manheim, Robert H. Meade, and Gerard C. Bond.
Science, Vol 167, p 371-376, January 1970. 6 p, 4 fig, 3 tab, 24 ref.

Descriptors: *Suspended load, *Sea water, *Atlantic coastal plain, *Water pollution sources, Surveys, Sampling, Currents (Water), Ocean currents, Sediment distribution, Sediment load.
Identifiers: Atlantic continental margin.

Appreciable amounts of suspended matter over 1.0 milligram per liter in surface waters are restricted to within a few kilometers of the Atlantic coast. Particles that escape estuaries or are discharged by rivers into the shelf region tend to travel longshoreward rather than seaward. Suspended matter farther offshore, chiefly amorphous organic particles, totals 0.1 milligram per liter or less. Soot, fly ash, processed cellulose, and other pollutants are widespread. (Knapp-USGS)

SOIL EROSION IN THE DETROIT METROPOLITAN AREA,
Soil Conservation Service, East Lansing, Mich.
J. R. Thompson.
Journal of Soil and Water Conservation, Vol 25, No 1, p 8-10, January-February 1970. 3 p, 3 fig, 4 tab, 4 ref.

Descriptors: *Soil erosion, *Urbanization, *Michigan, Cities, Runoff, Soil conservation, Land use, Roads, Sediment yield, Construction, Road construction, Sediment control.
Identifiers: Detroit (Mich).

A study was made in the Detroit metropolitan area to evaluate the rates and amounts of erosion from urban construction sites. In the summer of 1968, 2.1% of an urban zone was under development. This zone produced about the same amount of eroded soil material as the remaining 97.9% of the area. Erosion from the developing areas averaged 69 tons per acre per year, compared with an overall average erosion rate for the metropolitan area of about 3.0 tons per acre per year and an overall average erosion rate for southeast Michigan of 2.6 tons per acre per year. (Knapp-USGS)

TOTAL SEDIMENT DISCHARGE OF SELECTED STREAMS IN KANSAS, 1957-65, A COMPILATION,
Geological Survey, Lawrence, Kans.
C. D. Albert.
Kansas Water Resources Board Bulletin No 10, June 1969. 8 p, 1 fig, 1 tab, 8 ref.

Descriptors: *Sediment load, *Streams, *Kansas, *Sediment discharge, Sediment transport, Bed load, Suspended load, Discharge (Water), Streamflow, Particle size, Data collections, Hydrologic data.
Identifiers: Sediment sampling.

Computed total sediment discharges for selected streams in Kansas are presented. The suspended load is computed from analyses of depth-integrated samples, but the design of the suspended-sediment sampling equipment prevents sampling within about 0.3 foot of the stream bottom. In a sand-bed stream the sediment concentration normally is higher and the particle size larger in the unsampled zone than in the sampled zone. Thus, the total sediment discharge of many streams may be appreciably greater than that indicated by suspended-sediment samples alone. Several different formulas and procedures have been used to determine the total sediment discharge of streams. A procedure developed by H. A. Einstein (1950) was modified by Colby and Hembree (1955) and was simplified again by Colby and Hubbell (1961). The latter modification, which includes graphical methods to eliminate cumbersome computations, was used to obtain the results shown in the data tabulation. (Knapp-USGS)

MECHANICS OF THE SUCCESSIVE SALTATION OF A SAND PARTICLE ON A GRANULAR BED IN A TURBULENT STREAM,
Kyoto Univ., (Japan). Disasters Prevention Research Inst.
Yoshito Tsuchiya.
Bulletin Disaster Prevention Research Institute, Vol 19, Part 1, Paper 152, p 31-44, August 1969. 14 p, 8 fig, 1 photo, 10 ref.

Descriptors: *Erosion, *Sediment transport, *Sands, *Saltation, Alluvial channels, Turbulent flow, Streamflow, Mathematical studies, Mathematical models.
Identifiers: Movable beds.

Most of the saltating sand particles on a granular bed in a turbulent stream successively continue saltation after initial motion. In this paper, such a saltation motion is defined as successive saltation. A theory of the successive saltation of a single sand particle on a granular bed is proposed on the basis of the equation of motion for saltation and the dynamic characteristics of collision between a saltating sand particle and bed sand particles. The theoretical relationships for the saltation height and distance and for their distribution characteristics are in good agreement with the results of experiments. (Knapp-USGS)
W70-04582

FIELD MEASUREMENT OF THE INITIATION OF LARGE BED PARTICLE MOTION IN BLUE CREEK NEAR KLAMATH, CALIFORNIA,
Geological Survey, Washington, D.C.
E. J. Helley.
Report available for sale by Superintendent of Documents, U S Government Printing Office, Washington, D C 20402 - Price 35 cents. Geological Survey Professional Paper 562-G, p G1-G19, 1969. 19 p, 15 fig, 2 tab, 26 ref.

Descriptors: *Sediment transport, *Bed load, *Alluvial channels, Hydraulics, Movement, Scour, Erosion, Tractive forces, Velocity, Streamflow, Sedimentation.
Identifiers: Particle movement initiation.

In a field sediment transport study, more than two-thirds of measurements of bed velocity necessary to initiate motion of coarse natural particles agree within 20% of those velocities predicted from theory. The theory is based on balancing turning moments of the fluid forces of drag and lift with the resisting moment of the submerged particle weight. Initial motion seems to depend more on size and shape than on specific gravity or orientation angle. In fact, shape differences almost completely compensate for differences in specific gravity from 2.65-3.00 and at orientation angles from 0 deg-25 deg. Bed velocities necessary to initiate motion of coarse bed material in Blue Creek are equaled or exceeded about 5% of the time. This fact and changes in channel topography and cross-sectional area emphasize the ability of perennial mountain streams to transport coarse bed material frequently. (Knapp-USGS)

A NEW METHOD TO DETERMINE THE SPHERICITY OF MOBILE SEDIMENTS,
Centre Universitaire Marseille-Luminy, Marseille (France). Geology Lab.
Pierre Weydert.
Sedimentology, Vol 13, No 1-2, p 71-83, October 1969. 13 p, 5 fig, 4 tab, 17 ref.

Descriptors: *Particle shape, *Sediments, *Analytical techniques, *Sieves, *Sieve analysis, Instrumentation, Separation techniques, Measurement, Sedimentology, Statistical methods, Sampling.
Identifiers: Particle shape analysis, Sphericity, Roundness.

A new method is presented to determine the sphericity of sand particles with sedimentary analysis. Two different sieves are used: one with open squares; the other with circular openings. Experimentation shows that particles crossed the open-square sieves in diagonal positions. A sediment, which is composed of subspherical particles, is represented by two cumulative curves on the same graph. If the sediment is very angular, the two curves are disconcerted, while if the sediment is subspherical, the difference between the two curves is maximum. The sphericity values obtained are comparable with those of visual charts. (Knapp-USGS)

DETERMINATION OF SILTING IN WATER BASIN BY MEANS OF SOLID TRANSPORT BALANCE, (IN FRENCH),
State Inst. of Hydrology and Meteorology, Krakow (Poland).
J. Cyberski.
English summary included. In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 741-746, 1966. 6 p, 2 fig, 8 ref. English summary included.

Descriptors: *Reservoir silting, *Forecasting, *Sedimentation, Bed load, Suspended load, Provenance, Sediment yield, Silts, Erosion, Sediment transport.
Identifiers: *Poland, Dunajec River.

A method to determine the silting of reservoirs is presented and applied to the Roznow Reservoir, Poland. The method is based on many years of observations and measurements of water stage, discharge and silt charge of the Dunajec River, as well as special research on the damage of the shores, and the bed load coming from small streams. The main sources of sediment supplying the reservoir are the suspended and bed loads of the Dunajec River and of the small streams flowing into the reservoir. In the total amount of the silting the participation of the solid transport from individual sources is variable. The basic component is the suspended load of the Dunajec River; a small percentage is due to the bed load from the streams flowing into the reservoir and the bed load coming from Dunajec river. Only 1 percent originates in the bed load from the shore denudation. (Knapp-USGS)
W70-04751

EVALUATION OF FACTORS AFFECTING RESERVOIR SEDIMENT DEPOSITION,
Corps of Engineers, Rock Island, Ill., Iowa Univ., Ames, and Argicultural Research Service, Columbia, Mo.
C. W. Farnham, C. E. Beer, and H. G. Heinemann.
In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 747-758, 1966. 12 p, 2 fig, 2 tab, 13 ref.

Descriptors: *Reservoir silting, *Forecasting, *Sedimentation, *Statistical methods, Regression analysis, Iowa, Missouri, Erosion, Sediment transport, Land management, Provenance, Loess, Missouri River.
Identifiers: *Missouri River basin.

Detailed field surveys were made of existing reservoirs in the loessial hills of western Iowa and northwestern Missouri to determine the rate of sediment accumulation. Additional data were secured to evaluate the variables associated with reservoir trap efficiency, with delivery of sediment to reservoir and with gross erosion from the contributing watershed area. Through the use of multiple regression techniques, the rate of sediment deposition in the reservoirs was expressed as a function of computer gross erosion and measured reservoir and watershed variables. The results show that the amount of sediment deposited in the reservoir is highly correlated with the computed gross erosion. The remaining variation was explained as a function of variables defining the reservoir trap efficiency and watershed delivery ratio. A greater insight was obtained of the importance of land management and the interaction of reservoir and watershed variables as they affect reservoir sedimentation. (Knapp-USGS)
W70-04752

SEDIMENTATION IN A SMALL CHANNEL-TYPE RESERVOIR,
Agricultural Research Service, Columbia, Mo. Soil and Water Conservation Div., and Missouri Univ., Columbia. Dept. of Zoology.
H. G. Heinemann, D. L. Rausch, and R. S. Campbell.
In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 769-779, 1966. 11 p, 5 fig, 1 tab, 9 ref.

Descriptors: *Reservoir silting, *Forecasting, *Sedimentation, *Surveys, Water quality, Thermal stratification, Silts, Clays, Model studies, Water circulation, Sediment transport, Particle size, Solutes, Provenance, Reservoir design.
Identifiers: *Ashland Lake (Missouri), Channel reservoirs.

Ashland Lake in central Missouri is a channel-type reservoir that was built in 1937 with a capacity of about 346,000 cubic meters. Its drainage area is 979 hectares. A study of its sedimentation was undertaken to provide essential design information. Detailed reservoir sedimentation surveys were made in 1949, 1951, 1955 and 1962. The distribution of sediment in the vertical and in the horizontal planes remained fairly constant between surveys. The particle-size distribution of the deposited sediment was found to vary, depending on the distance from the dam. The volume-weight of the sediment increased with depth in the deposit and decreased with percent clay. Physical and chemical measurements of the lake water show that Ashland Lake is stratified thermally May through October, confining circulation to the upper one-third of the lake. Water turbidity may reach 200 ppm (platinum wire). Concentrations of cations are less than amounts considered effective in flocculation of clay particles. (Knapp-USGS)
W70-04753

LAYERED SEDIMENTS OF TIDAL FLATS, BEACHES, AND SHELF BOTTOMS OF THE NORTH SEA,
Research Inst. for Geology and Biology. Wilhelmshaven (West Germany).
H. E. Reineck.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 191-206, 1967. 16 p, 32 fig, 3 tab, 43 ref.

Descriptors: *Sedimentary structures, *Sediments, *Beaches, *Mud flats, Continental shelf, Sedimentation rates, Provenance, Ripple marks, Sand waves, Sedimentation, Sands, Clays, Marshes.
Identifiers: *North Sea, Laminated sand, Ripple bedding, Lenticular bedding, Laminated bedding, Salt marsh.

Deposits of a particular environment are influenced by the type of available sediments, physical processes and their intensity, rate of sedimentation, and biogenetic factors. Sedimentary structures show the nature of water movement. For example, horizontal silty-clay lamellae are found in areas with little water movement whereas cross-bedded sands are a result of greater water movement. The characteristics of the following sedimentary structures are discussed and illustrated: (1) laminated sand; (2) ripple bedding; (3) lenticular bedding; (4) fine rhythmically laminated bedding; (5) coarse rhythmically laminated bedding; (6) mud deposits; (7) salt marsh or flood deposits; and (8) bioturbate structures. The distribution of sedimentary structures on salt marsh, tidal flat, sand flat, shore area and inshore to shelf area is given. (Carstea-USGS)

SEDIMENTS OF YAQUINA BAY, OREGON,
Oregon State Univ., Corvallis. Dept. of Oceanography.
L. D. Kulm, and John V. Byrne.

In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 226-238, 1967. 13 p, 12 fig, 13 ref. ONR Contract Nonr 1286 (10).

Descriptors: *Sediments, *Sedimentation, *Oregon, *Bays, Estuaries, Deposition (Sediments), Minerology, Particle size, Provenance, Sands, Sediment transport, Beaches, Mixing, Salinity, Shoals, Dredging, Sedimentation rates.
Identifiers: Yaquina Bay (Oregon).

Marine, fluviatile and marine-fluviatile deposition were defined in Yaquina Bay on the basis of sediment texture and mineralogy. Seasonal sedimentation, sources of recent sediments, and transport of marine sand from adjacent ocean beaches are described. Quantitative information about salinity mixing, shoaling, rates of deposition, source of shoaling material, and effects of improvement works on sediment deposition along the adjacent ocean beaches is given. Known areas of shoaling occur on the bar, in the main channel, and in the turning basin. Estimated average rate of deposition in the dredged channel is 9 inches per year. (Carstea-USGS)

THE SEDIMENTS OF CHESAPEAKE BAY,
Maryland Univ., Solomons. Natural Resources Inst.
Robert B. Biggs.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 239-260, 1967. 22 p, 26 fig, 8 tab, 49 ref.

Descriptors: *Sediments, *Sedimentation, *Water quality, *Bays, Water chemistry, Mineralogy, Clay minerals, Acidity, Color, Mixing, Oxidation, Reduction potential, Oxygen, Organic matter, Iron, Sulfur compounds.
Identifiers: *Chesapeake Bay, Pore water analysis, Sediment-water relationships.

Data from geological and oceanographic investigations of Chesapeake Bay show correlations between sediment types and dominating influences. A typical sequence of measured parameters and major influences of these parameters, both in the water column and the sediment, are presented. The parameters observed were pH, oxygen concentration, sulfate concentration, and Eh in the water column and pore water of the bed sediments. The color and water content of the sediments are also discussed. These parameters were related to the influences of mixing, oxidation, reduction, biological and bacterial activity, hydrotroilite concentration, and state of organic matter, iron, and sulfur species. (Carstea-USGS)

CONTRASTS IN COASTAL BAY SEDIMENTS ON THE GULF AND PACIFIC OCASTS,
University of Southern California, Los Angeles. Dept. of Geological Sciences.
D. S. Gorsline.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 219-225, 1967. 7 p, 43 ref.

Descriptors: *Bays, *Coasts, *Sediments, *Sedimentation, *Estuaries, Lagoons, Sands, Beaches, Water circulation, Currents (Water), Tidal waters, Topography.
Identifiers: *Estuarine sedimentation, High-energy coasts, Low-energy coasts.

The general features of estuaries, estuarine sedimentation and sediment properties are discussed. Estuaries, bays, and lagoons are relatively new physical products and their age is not more than 3000 years. The major component of sediments in sand, and sedimentation patterns in these bodies of water are controlled by bottom topography and circulation. On high-energy coasts, estuaries are separated from the open sea by spits or beach deposits, and on low-and medium-energy coasts, estuaries are associated with coastal lagoons and barrier islands. Tidal currents are mainly responsible for circulation patterns in estuaries. The bulk of the sediment in estuaries is derived from seaward or coastal sources. Estuarine and bay sediments are relatively thin. (Carstea-USGS)

COMPARISON OF RECENT AND ANCIENT TIDAL FLAT AND ESTUARINE SEDIMENTS,
Pennsylvania Univ., Philadelphia. Dept. of Geology.
George De Vries Klein.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 207-218, 1967. 12 p, 7 fig, 63 ref.

Descriptors: *Estuaries, *Sediments, Mud flats, Sedimentation, Marshes, Water circulation, Shallow water, Channels, Sedimentary structures, Barriers, Clays.
Identifiers: Tidal flat sedimentation.

Recent tidal flat sediments and sedimentation are described for Wadden-type flats and Fundy-type tidal flats. In the Wadden type, sedimentation occurs along soft-sediment coasts, whereas in the Fundy type it occurs along bedrock coasts. Geographic interrelationships are summarized for the following sedimentary environments in Wadden-type flats: salt marshes, high tidal flats, low tidal flats, and tidal channels. In Fundy-type flats, the following major sedimentary environments are discussed: Wave cut benches, estuarine clay flats, tidal flats in the lee of barrier islands, and tidal marshes. Ancient tidal flat deposits are described from the upper devonian of Belgium, the lower Devonian of England, and the Pennsylvanian of Illinois. Deposition of evaporites in the geological past required an estuarine circulation system and; therefore, it took place in mixed shallow marine environments. (Carstea-USGS)

SOME VARIABLES WHICH INFLUENCE RATES OF RESERVOIR SEDIMENTATION IN WESTERN UNITED STATES,
Soil Conservation Service, Portland, Oreg. Engineering and Watershed Planning Unit.
Elliott M. Flaxman.
French resume included. In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 824-838, 1966. 15 p, 4 fig, 3 tab, 4 ref.

Descriptors: *Reservoir silting, *Reservoir design, *Sediment transport, *Provenance, Statistical methods, Regression analysis, Aggradation, Runoff, Vegetation effects, Erosion, Rainfall-runoff relationships, Topography, Rainfall intensity.
Identifiers: *Sediment storage, Western U.S.

Predictions of sediment storage requirements are needed in the design of flood detention and water supply reservoirs in order to sustain an adequate capacity for intended purposes. In western United States the wide range in geologic, topographic, climatic, soils and vegetative conditions includes a number of factors which operate to increase or decrease rates of sediment deposition. To determine the influence of some watershed and reservoir variables on this problem, statistical procedures were used to analyze data from 30 locations in 9 states. Multiple regression and principal component regression with varimax rotation of the factor weight matrix were used. Variables include expressions for runoff, related vegetative response, rainfall intensity, topography, soil characteristics, the density of deposits, and trap efficiency of the reservoirs. The results of the analysis and predictive equations for sedimentation rates and for density of reservoir deposits are given. (Knapp-USGS)

SEDIMENT DESIGN REQUIREMENT FOR SMALL RESERVOIRS,
Soil Conservation Service, Washington, D.C. Engineering Div.
John W. Roehl.
French resume included. In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 795-803, 1966. 9 p, 3 fig, 9 ref.

Descriptors: *Reservoir silting, *Farm ponds, *Reservoir design, Sediment yield, Sediment transport, Reservoir yield, Erosion, Runoff, Soil conservation, Soil erosion, Land management.
Identifiers: Soil Conservation Service.

The Soil Conservation Service, through the Watershed Protection Program, designs and constructs several hundreds of small floodwater retarding and multiple-purpose structures each year. A procedure has been developed for humid areas that provides the information concerning the sedimentation aspects required for the design of these structures. Involved in this procedure are quantitative estimates of erosion occurring in the drainage areas, the resultant sediment yields, the trap efficiency of the reservoir, and the volume weight and distribution of the deposited sediment within the reservoir. The success of the sediment design procedure is illustrated by comparisons of the computed requirements and the measured accumulation in selected reservoirs. (Knapp-USGS)

2K. Chemical Processes

CHEMISTRY OF MANGANESE IN NATURAL WATERS,
Soil Research Labs., Amritsar (India).
B. K. Handa.
Chemical Geology, Vol 5, No 3, p 161-165, January 1970. 5 p, 1 fig, 2 tab, 6 ref.

Descriptors: *Water chemistry, *Manganese, *Chemical precipitation, Calcium carbonate, Groundwater, Oxidation, Chemical reactions, Geochemistry, Trace elements.
Identifiers: Manganese complex ions.

In natural waters, manganese salts are much more stable than the corresponding iron salts. While the precipitation of iron was found to be complete within 48 hours from the time of collection of the water sample, generally only a small fraction of the total manganese had precipitated in about a week's time. However, once the precipitation starts, the process becomes relatively more rapid, perhaps due to autocatalysis. Even when precipitation of calcium carbonate occurs, some manganese may still remain in solution. (Knapp-USGS)

COMPOSITION AND ORIGIN OF IRON-ORE SEDIMENTS AND HOT BRINES IN THE RED SEA,
Akademiya Nauk SSSR. Institut Okeanologii.
G. N. Baturin, A. V. Kochenov, and Ye. S. Trimonis.
Transl from Okeanologiya, Akad Nauk SSSR, Moscow, Vol 9, No 3. Oceanology, Vol 9, No 3, p 360-368, 1969. 9 p, 2 fig, 8 tab, 28 ref.

Descriptors: *Brines, *Saline water, *Iron oxides, *Bottom sediments, Oceanography, Water chemistry, Mineralogy, Water temperature, Chemical precipitation, Salts.
Identifiers: Red Sea, Iron deposits.

The hot brines in depressions of the central Red Sea contain thousands of times more iron, manganese and other nonferrous metals than the sea water. After removal of salts, approximately half of the sediments of these depressions consists of iron hydroxides and they are enriched with zinc, copper, lead and molybdenum. Hydrothermal deposits with the same complex of metals, located along the coast of the Red Sea, are correlated with faults and may be due to occurrences of Tertiary volcanism. Brines of similar composition to those in the Red Sea are known in the Cheleken Peninsula. Geological and geochemical data indicate that such brines are of relatively deep origin. (Knapp-USGS)
W70-04569

FORMATION OF BRINES IN BOTTOM DEPRESSIONS OF THE RED SEA,
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
S. I. Smirnov.
Transl from Okeanologiya, Akad Nauk SSSR, Moscow, Vol 9, No 3. Oceanology, Vol 9, No 3, p 355-360, 1969. 6 p, 3 fig, 9 ref.

Descriptors: *Brines, *Saline water, Sea water, Connate water, Salts, Salinity, Trace elements, Chlorides, Faults (Geology), Fractures (Geology), Water chemistry.
Identifiers: *Red Sea, Evaporite deposits.

The brines in the grabenlike bottom depressions of the Red Sea were formed by outflow of evaporite brines from Miocene salt-bearing deposits. This flow took place about 3500 years ago. In addition to high salinity (up to 310 g/liter), the brines have relatively high contents of potassium, iron, manganese, zinc, etc. Salt-bearing and gypsum-bearing Miocene rocks of thickness more than 2000-3000 m occur extensively in the Red Sea and adjoining land areas. (Knapp-USGS)
W70-04570

CHANGES IN CHEMICAL QUALITY OF GROUNDWATER IN THREE AREAS IN THE GREAT BASIN, UTAH,
Geological Survey, Salt Lake City, Utah.
A. H. Handy, R. W. Mower, and G. W. Sandberg.
Available for sale from Superintendent of Documents U S Government Printing Office, Washington, D C 20402-Price $3.75. Geological Survey Research 1969, Professional Paper 650-D, p D228-D234, 1969. 7 p, 8 fig, 1 tab, 7 ref.

Descriptors: *Water quality, *Groundwater, *Utah, *Saline water, Monitoring, Artesian wells, Water chemistry, Withdrawal, Water levels, Water level fluctuations, Irrigation water, Leaching, Infiltration, Evaporation, Hydrogeology.
Identifiers: Great Basin (Utah).

The chemical quality of groundwater in three areas in the Great Basin, Utah, is known to be deteriorating. West of Kanosh in Pavant Valley, an increase in all major constituents except bicarbonate has been associated with a decline in water levels that has resulted from a high rate of pumping. In the upper artesian aquifer near Leamington, in the Sevier Desert, an increase in dissolved solids, mainly sodium and chloride, has resulted from a change in the chemical quality of the water that is recharging the aquifer. Between Beryl and Enterprise in Escalante Valley, an increase in the concentration of all major constituents also has been associated with a decline in water levels caused by a high rate of pumping. (Knapp-USGS)

THE MIGRATION OF MANGANESE IN THE ARCTIC BASIN SEDIMENT,
Harvard Univ., Cambridge, Mass. Dept. of Geological Sciences; University of Southern California, Los Angeles. Dept. of Geological Sciences; and Lamont-Doherty Geological Observatory, Palisades, N. Y.
Yuan-Hui Li, James Bischoff, and Guy Mathieu.
Earth and Planetary Science Letters, Vol 7, No 3, p 265-270, December 1969. 6 p, 1 fig, 1 tab, 26 ref. ONR Contract Nonr 266 (82); NSF Grants Ga-4239 and Ga-1419.

Descriptors: *Water chemistry, *Sea water, *Bottom sediments, *Arctic Ocean, *Manganese sampling, Cores, Analytical techniques, X-ray analysis, X-ray spectroscopy.
Identifiers: Arctic Basin.

A relatively high content of manganese at the top of an arctic sediment core and a smooth exponential increment of manganese concentration in its interstitial water down to one meter have been found. The data strongly support the idea that manganese may be remobilized after burial by local reducing conditions. The thermodynamic calculation shows that the interstitial water is reaching chemical equilibrium with respect to manganese carbonate precipitate in the deeper part of the sediment. (Knapp-USGS)
W70-04591

CHEMICAL REACTION BETWEEN RECHARGE WATER AND AQUIFER WATER,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio. Cincinnati Water Research Lab.; and Cincinnati Univ., Ohio. Dept. of Mathematics.
D. L. Warner, and L. F. Doty.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 278-288, 1967. 11 p, 4 fig, 1 tab, 15 ref.

Descriptors: *Water chemistry, *Artificial recharge, Injection wells, Corrosion, Inhibition, Stabilization, Chemical precipitation, Water quality, Mixing, Chemical reactions, Physicochemical properties.
Identifiers: Injection well fouling, Water compatibility.

Chemical reaction between recharge water and aquifer water may influence water quality and aquifer permeability, and may cause fouling in discharge wells. However, evidence suggests that the danger of permeability reduction may not be very great. Precipitates of calcium and magnesium carbonate and iron compounds are the most likely reaction products. The amount and distribution of reactive chemicals remaining in solution can be related to the dispersive characteristics of a porous medium. Reactions of various rates are considered. It may be desirable to prevent reaction. It is suggested that, in some cases, this can be accomplished by emplacing a buffer zone of nonreactive water between the recharge water and the aquifer water. (Knapp-USGS)

THE NEBRASKA WATER QUALITY SURVEY,
Nebraska Univ., Lincoln. Coll. of Agriculture and Home Economics.
D. Knudsen, C. A. Hoover, P. Fischbach, and D. D. Axthelm.
Nebraska University Extension Service Report E. C. 65-165, November 1965. 26 p, 7 fig, 11 tab, 18 ref, append.

Descriptors: *Water quality, *Irrigation water, *Nebraska, *Groundwater, *Water pollution, Water chemistry, Water analysis, Data collections, Hydrologic data, Nitrates, Water pollution sources, Corrosion.
Identifiers: Groundwater pollution.

In general, the quality of Nebraska groundwater is good. There are, however, areas in the state where management practices should be followed to prevent excessive accumulation of salts. Potassium, calcium, magnesium and sulfur, all essential nutrient elements, are generally present in substantial quantities in Nebraska groundwater. Nearly two-thirds of the water samples tested contained enough boron to prevent boron deficiency in most crops. Thirty of the 1,166 samples tested furing the 1961 irrigation season had concentrations of 10 ppm or more nitrate-nitrogen. The 1,200 irrigation water samples of the year 1961 represent about 5% of the irrigation wells in the area of the state irrigated from groundwater. Laboratory determinations were made by the University of Nebraska Soil Testing Service for: Specific conductance, pH, Calcium, Sodium, Magnesium, Potassium, Nitrate, Phosphate, Carbonate, Bicarbonate, Chloride, Sulfate, Iron, and Boron. GEOCHEMISTRY OF SOME PETROLEUM-ASSOCIATED WATERS FROM LOUISIANA,
Bureau of Mines, Bartlesville, Okla. Petroleum Research Center.
A. Gene Collins.

Bureau of Mines Report of Investigations 7326, January 1970. 31 p, 9 fig, 12 tab, 51 ref.

Descriptors: *Geochemistry, *Brines, *Oil fields, *Louisiana, Dolomite, Diagenesis, Connate water, Water chemistry, Geologic formations, Oil reservoirs, Saline water, Groundwater.
Identifiers: Oil field brines.

Some of the geochemical relationships between subsurface fluids and the geologic strata in petroleum-producing areas of Louisiana were determined. Samples of petroleum-associated water were obtained from 126 wells in Louisiana from sediments of Tertiary, Cretaceous, and Jurassic ages. The dissolved constituents were compared with those of a brine that was concentrated by evaporation. The concentrations of bromide, calcium, and strontium were useful in distinguishing the brines produced from sediments of a late age from those of an earlier age. The concentration ratios of Mg and bromide indicated that dolomitization probably had occurred and altered the composition of the brines. A principal-components analysis of the data indicated an inverse relationship between depth and concentrations of bromide, strontium, calcium, and lithium. (Knapp-USGS)
W70-04710

ISOTOPIC ABUNDANCE OF OXYGEN AND SULFUR IN SULFATE IONS FROM RIVER WATER,
Laboratory of Nuclear Geology, Pisa (Italy).
A. Longinelli, and G. Cortecci.
Earth and Planetary Science Letters, Vol 7, No 4, p 376-380, January 1970. 5 p, 4 fig, 1 tab, 9 ref.

Descriptors: *Stable isotopes, *Oxygen, *Sulfur, *Water chemistry, Solutes, Biochemistry, Water analysis, Aquatic microorganisms.
Identifiers: Isotope fractionation, Oxygen isotopes, Sulfur isotopes, Italy.

The isotopic composition of dissolved sulfate has been studied in the Arno and Serchio Rivers in Tuscany (Italy). Large isotopic variations in both oxygen and sulfur take place along the course of these rivers in the direction of a progressive enrichment in the heavy isotopes. It is difficult to explain the results obtained, which are probably caused by several different factors. One of these factors is probably a widespread microbiological activity. (Knapp-USGS)
W70-04715

CHEMICAL QUALITY OF SURFACE WATER IN THE UMPQUA RIVER BASIN, OREGON,
Geological Survey, Portland, Oreg.
D. A. Curtiss.
Geological Survey Open-file report, 1969. 25 p, 4 fig, 6 tab, 8 ref.

Descriptors: *Water quality, *Surface waters, *Oxygen, Water chemistry, Solutes, Nutrients, Pesticides, Monitoring, Water pollution sources, Water supply, Data collections, Hydrologic data.
Identifiers: Umpqua River (Oregon), Douglas County (Oregon).

Samples were collected at 32 sites in the Umpqua River basin, Oregon; six of these sites were sampled and analyzed at 6-week intervals. The surface water is of generally excellent chemical quality throughout the basin. Analysis of water samples from two selected sites revealed detectable amounts of pesticides during the summer and fall of 1967. Herbicides were not detected during the study period. All surface water within the basin has a low sodium hazard and only traces of boron, and is therefore excellent for irrigation. A potential problem area exists on the South Umpqua River downstream from Roseburg. Because of heavy organic enrichment, insufficient discharge during low-flow periods and high temperatures during summer could cause water-quality problems. The water quality in this reach of the river should be monitored on a regular basis. (Knapp-USGS)
W70-04722

A ROUTINE METHOD FOR THE DETERMINATION OF TRITIUM BY ELECTROLYTIC CONCENTRATION BEFORE LIQUID SCINTILLATION COUNTING,
Ministry of Technology, London (England). Lab. of the Government Chemist.
P. Metson.
Analyst, Vol 94, No 1125, p 1122-1129, December 1969. 8 p, 4 fig, 2 tab, 17 ref.

Descriptors: *Tritium, *Water analysis, Analytical techniques, Radiochemical analysis, Radioisotopes, Electrolysis.
Identifiers: Tritium analysis.

A routine method is described for the measurement of tritium in rain and river waters by liquid scintillation counting after enrichment by electrolysis. A relatively large enrichment is achieved in a small cell by use of a continuous feed system that requires a minimum of attention. Electrolysis is carried out in a bank of standardized cells, and activities are obtained to an accuracy of better than 15% without the need for deuterium determinations. (Knapp-USGS)
W70-04735

IONIC CONCENTRATION GRADIENTS IN PERMAFROST, BARROW, ALASKA,
Army Terrestrial Sciences Center, Hanover, N.H.
Jerry Brown.
Cold Regions Research and Engineering Laboratory Research Report 272, October 1969. 25 p, 3 fig, 16 ref, 1 append. DA Task 1T061102B52A02.

Descriptors: *Permafrost, *Soil chemistry, *Water chemistry, *Solutes, Ions, Aqueous solutions, Leaching, Geomorphology, Freezing, Melting, Ion transport, Tundra, Soil water movement, Sea water.
Identifiers: Ionic concentration gradients.

The ionic concentration gradients of soils and permafrost sediments were investigated to provide a means of interpreting present and past chemical activity and geomorphological processes in the Arctic coastal plain environment. Within short distances at comparably shallow depths and in sediments of similar texture, ionic concentrations commonly vary between less than 1 meq/100 g and 10 meq/100 g. These differences represent modification of the marine sediment by such processes as lake migration and freshening, local and regional thawing, and leaching followed by refreezing of the ground. Higher concentrations (more than 5 meq/100 g) are found close to the surface in areas unaffected by such processes. Lower values (less than 5 meq/100 g) are encountered in present and ancient lake basins and under several apparent primary land surfaces. Two areas, one a drained lake basin and the other a well-developed polygon field, show depression of the ionic concentrations both vertically and laterally. A large drained basin situated close to sea level contains frozen sediments having very low ionic concentrations; this suggests the prior existence of a fresh-water lake. The seasonally thawed soil contains, on an average, 24 times fewer extractable ions than the underlying permafrost. Data for all samples are tabulated and include moisture content, conductivity of solution, and concentrations in solution and soils. (Knapp-USGS)

CHEMICAL ENVIRONMENT IN THE AQUATIC HABITAT,
Koninklijke Nederlandse Akademie van Wetenschappen, Amsterdam.
H. L. Golterman, and R. S. Clymo.
Proceedings of International Biological Program Symposium held in Amsterdam and Nieuwersluis, Netherlands, October 10-16, 1966. N V Noord-Hollandsche Uitgevers Maatschappij, Amsterdam, 1967. 322 p.

Descriptors: *Aquatic habitats, *Chemical analysis, *Aquatic environment, *Conferences, Environmental effects, Productivity, Physiological ecology, Organic matter, Bioassays, Nutrients, Phosphorus compounds, Nitrogen compounds, Nitrogen fixation, Oxidation reduction potential, Hydrogen ion concentration, Oxygen, Iron, Salinity, Vitamins, Sea water, Estuaries, Lakes, Plant pigments, Sediment-water interfaces, Molybdenum, Algae.
Identifiers: *Chemical environment, Hydrochemistry, International Biological Program, Netherlands, Netherlands Organization for Pure Scientific Research, Amsterdam (Holland), Nieuwersluis (Holland), Royal Netherlands Academy of Sciences, Hydrobiological Institute (Netherlands), Silicon compounds, Humic substances, Micronutrients, Microcompounds, Nutrient availability, Glucose, Acetate, Pheromones.

In October 1966, a symposium met at Royal Netherlands Academy of Sciences (Amsterdam) and Hydrobiological Institute (Nieuwersluis) to consider biologically-related problems of hydrochemistry. The conference, which this volume records, was sponsored by International Biological Program and Netherlands Organization for Pure Scientific Research. With an objective of preparing a manual of standardized methods, participants considered four types of problems: fate and determination of organic substances; availability of specific nutrient elements; physico chemical phenomena including nitrogen fixation, pH regulation, and interactions at sediment-water interfaces; and analytical techniques. Published proceedings are organized into 6 chapters as follows (numbers of contributions to each chapter indicated in parentheses): general papers (3); silicon, nitrogen, phosphorus compounds (5); technical papers (9); humic acids (2); micronutrients, microcompounds, and availability of compounds (6); miscellaneous topics (5). Topical coverage of some selected papers will indicate flavor, scope, and coverage of the symposium: 'integrative' and 'specific' properties of aquatic environments; quantitative relationships between nitrogen and phosphorus compounds in water and seston; automation in water analysis; composition and behavior of yellow acids in lacustrine water; determination of vitamins in seawater; pheromones and related substances; control of cations and pH in Sphagnum communities; mobility of sedimental compounds as related to sediment-water interchange. (See also W70-04882 and W70-04823). (Eichhorn-Wisconsin)

DIAGENESIS OF IRON SULFIDE IN RECENT MARINE SEDIMENTS,
Yale Univ., New Haven, Conn. Dept. of Geology.
Robert A. Berner.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 268-272, 1967. 5 p, 4 fig, 18 ref.

Descriptors: *Diagenesis, *Sulfides, *Sediments, Pyrite, Iron, Sulfur, Hydrogen sulfide, Thermodynamics, Oxidation-reduction potential, Acidity, Water chemistry.
Identifiers: *Hydrotroilite, Limonite, Goethite, Marcasite.

Hydrotroilite, a fine-grained, black, iron sulfide is frequently found in recent sediments. X-ray and chemical study of hydrotroilite is difficult because of its low concentration, extreme susceptibility to air oxidation and fine-grained nature. Laboratory studies of iron components used metallic iron, dissolved ferrous iron and synthetic and natural goethite. The Eh of sediments containing hydrogen sulfide is discussed. The stability of iron minerals in anaerobic marine sediments is best expressed in terms of Eh-pS (-2) diagrams calculated from thermodynamic data. The mechanisms of transformation of FeS to pyrite are discussed. (Carstea-USGS)

THE EFFECT OF STRONG STORMS ON SAND BEACHES OF THE BALTIC EASTERN SHORE,
Akademiya Nauk SSSR. Institut Okeanologii.
Yu. D. Shuyskiy.
Transl from Okeanologiya, Akad Nauk SSSR, Vol 9, No 3. Oceanology, Vol 9, No 3, p 388-391, 1969. 4 p, 3 fig, 6 ref.

Descriptors: *Beach erosion, *Sediment transport, *Storms, Ocean waves, Geomorphology, Littoral drift, Surf, Damages, Erosion.
Identifiers: Baltic Sea.

The Baltic suffered a very violent recurring storm during October 17-20, 1967. It washed away the dunes over the entire stretch of the coast from the Samland Peninsula to the Gulf of Riga. The extent of erosion was 8000-24,000 cu m/km in 15-16 h. Different types of erosion are observed in different parts of the coast. However, the profile of the submarine slope remained relatively stable to a depth of 7-8 m. The position of the water's edge did not change, with the exception of sectors with steep submarine slopes. SALT WATER ENCROACHMENT IN THE COASTAL PLAIN OF ISRAEL,
Ministry of Agriculture, Jerusalem (Israel). Hydrological Service.
S. Schmorak.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 305-318, 1967. 14 p, 9 fig, 4 ref.

Descriptors: *Saline water intrusion, *Saline water-freshwater interfaces, Observation wells, Monitoring, Logging (Recording), Groundwater movement, Arid lands, Electrical well logging, Water levels, Recharge, Discharge (Water), Aquifers.
Identifiers: *Israel.

Field investigations have been carried out by the Hydrological Service since 1954 in three rows of specially constructed interface wells in the Plio-Pleistocene aquifer along the Mediterranean Coast of Israel. The purpose of the investigations was to find the exact location of the interface, to follow up its movement and to ascertain the velocity of the propagation inland in order to enable a rational exploitation of the aquifer. Methods of chemical logging have been developed and instruments built for measuring of electrical conductivity and temperature in situ and for recording of the interface movement. The tidal movement of the water level and the corresponding movement of the interface is being automatically recorded. The velocity of salt water encroachment was found to be approximately 20-70 m per year. The horizontal boundary of the salt water (toe of interface) has been found to be 0.2-1.6 km from the sea (except in the Tel-Aviv Region where distance is more than 2 km). (Knapp-USGS)

A STUDY OF SELECTED CHEMICAL AND BIOLOGICAL CONDITIONS OF THE LOWER TRINITY RIVER AND THE UPPER TRINITY BAY,
Texas A and M Univ., College Station. Water Resources Inst.
R. J. Baldauf, J. Von Conner, H. W. Holcombe, and F. M. Truesdale.
Available from the Clearinghouse as PB-190 269, $3.00 in paper copy, $0.65 in microfiche. Technical Report No 26, Texas Water Resources Institute, February 1970. 168 p, 27 tab, 22 fig, 101 ref. OWRR Project A-007-TEX.

Descriptors: *Estuaries, Ecology, Environmental effects, *Acquatic environment, Estaurine environment, Estaurine fisheries, *Crabs, *Shrimp.
Identifiers: Water development effects, Blue crab, White shrimp, Brown shrimp, *Menhaden (Gulf), Trinity Bay, Wallisville Reservoir (Proposed).

The study was done on the site of the proposed Wallisville Reservoir, one of several multipurpose structures designed for the water development of the Trinity River Basin in Texas. The Dam is to be located at Trinity River mile 3.9, where it will traverse about 22,000 acres of a low salinity marsh. The completion of the Wallisville Dam is expected to alter both the character of the marsh and of the Trinity Bay portion of the Galveston Bay System. The Dam will serve as an effective saltwater barrier in addition to serving as a river-water impoundment structure; about 12,500 acres of low salinity marsh will be inundated by the conservation pool. The study shows that the entire area serves as a nursery ground for white and brown shrimp, blue crab, and menhaden, and that this area will be lost to the dam site. The construction of the dam at least 4.5 miles farther upstream would have spared considerable nursery acreage from destruction.
W70-04687

TIDAL VARIATION OF THE SUSPENDED SEDIMENT SIZE DISTRIBUTION AT A STATION IN UPPER CHESAPEAKE BAY,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
J. R. Schubel.
Chesapeake Bay Institute Technical Report 63, Reference 70-2, Johns Hopkins University, February 1970. 28 p, 8 fig, 5 tab, 4 ref.

Descriptors: *Sediment load, *Sedimentation, *Suspended load, *Estuaries, Particle size, Velocity, Currents (Water), Tides, Deposition (Sediments), Erosion, Scour, Sediment transport, Bays, Sampling, Surveys, Data collections.
Identifiers: Chesapeake Bay.

Sediment size analyses were made of suspended sediment samples collected over a tidal cycle in Chesapeake Bay at three depths in 9.5 m of water. At the surface the volume-weighted mean Stokes' diameter ranged from 2.9 to 3.7 microns while the concentration of suspended sediment varied from 11.2 to 14.6 mg/liter. At 8 m the mean Stokes' diameter, the standard deviation, and the concentration of suspended sediment were progressively larger with increasing current speed and had their slack water background values with waning tidal currents. The mean Stokes' diameter ranged from 2.9 to 11.7 microns, the standard deviation from 5.2 to 14.5 microns, and the concentration of suspended sediment from 13.8 to 93.0 mg/liter. At 9 m the same pattern was observed, but the variations were greater. The mean Stokes' diameter ranged from 3.3 microns near slack water to 22.9 microns at maximum current. The standard deviation ranged from 5.0 to 24.5 microns and the concentration of suspended sediment from 19.5 to 201.1 mg/liter. (Knapp-USGS)
W70-04696

OCEANIC MIXING,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
Akira Okubo.
Chesapeake Bay Institute, Technical Report 62, Reference 70-1, Johns Hopkins University, January 1970. 119 p, 17 fig, 160 ref. Contract AT (30-1)-3109, USAEC Contract Nonr 4010 (11) ONR.

Descriptors: *Mixing, *Oceans, *Ocean currents, *Reviews, *Bibliographies, Diffusion, Turbulence, Advection, Convection, Environment, Path of pollutants, Mathematical models, Model studies.
Identifiers: Oceanic mixing.

The present knowledge of oceanic mixing is summarized. Two processes, 'advection' and 'diffusion,' which contribute substantially to oceanic mixing and their interaction are recognized in the mechanism of mixing. Environmental features of the sea in relation to advective and diffusive processes are also described. An annotated bibliography is included. (Knapp-USGS)
W70-04697

A DESCRIPTION OF THE SEASONAL THERMOCLINE CYCLE IN SHALLOW COASTAL WATER,
Naval Undersea Research and Development Center, San Diego, Calif.
J. L. Cairns, and K. W. Nelson.
Journal of Geophysical Research, Vol 75, No 6, p 1127-1131, February 20, 1970. 5 p, 5 fig, 8 ref.

Descriptors: *Water temperature, *Sea water, *Thermocline, *Thermal stratification, *Coasts, California, Pacific Ocean, Ocean currents.
Identifiers: San Diego (Calif).

Details of the annual thermocline cycle in the coastal area off San Diego have been determined from temperature data recorded hourly for over a year at the Naval Undersea Research and Development Center Oceanographic Tower. Vertical thermal gradients averaged 0.59 deg C/m at their strongest part from late April through early September. The sharpest gradients, which occurred in late June, were as great as 1.27 deg C/m. Transient gradients averaging 0.29 deg C/m at their strongest part occurred frequently in late March and early April and from late September through early November. Weak thermal gradients averaging 0.15 deg C/m at their sharpest predominated from late November through early March. Water temperature varied from 9.7 deg to 23.6 deg C. Internal tides persisted throughout the year, contributing to monthly temperature variances that ranged from 0.2 in January to 5.6 in May and August. (Knapp-USGS)
W70-04706

A NOTE ON THE THERMAL STRUCTURE OF THE EASTERN BERING SEA,
Hokkaido Regional Fisheries (Japan). Research Lab.
Kiyomitsu Kitano.
Journal of Geophysical Research, Vol 75, No 6, p 1110-1115, February 20, 1970. 6 p, 5 fig, 13 ref.

Descriptors: *Thermal stratification, *Ocean circulation, *Ocean currents, Oceanography, Water temperature, Mixing.
Identifiers: *Bering Sea, Aleutian Islands.

A detailed thermal structure in the eastern Bering Sea is described, based on data obtained during the summers of 1964-66. Extremely cold water moves over the continental shelf in the eastern Bering Sea and warm water intrudes mainly across the Amukta and Amchitka passes. Some of the tendency of decrease and increase of temperature is also shown by a vertical section. The typical feature of vertical temperature distribution is the presence of five stratified thermal layers. (Knapp-USGS)
W70-04708

AN OPTICAL AND HYDROGRAPHIC STUDY OF A TEMPERATURE INVERSION OFF OREGON DURING UPWELLING,
Oregon State Univ., Corvallis. Dept. of Oceanography.
Hasong Pak, George F. Beardsley, Jr., and Robert L. Smith.
Journal of Geophysical Research, Vol 75, No 3, p 629-636, January 20, 1970. 8 p, 8 fig, 12 ref. ONR Contract Nonr 1286 (10).

Descriptors: *Ocean circulation, *Water temperature, *Productivity, Oregon, Oceanography, Ocean currents, Thermal stratification, Hydrography, Sounding, Surveys.
Identifiers: Ocean upwelling.

Optical and hydrographic measurements made in June 1967 during upwelling along the Oregon coast showed a temperature inversion starting 3 km from the shore and extending to 13 km from the shore. The thermal inversion was accompanied by a turbidity maximum in the permanent pycnocline. The mechanism for the formation of the temperature inversion and turbidity maximum appears to be cold, saline water upwelling from beneath the permanent pycnocline to the surface close to the coast, absorbing heat, and becoming biologically productive. This modified upwelled water then appears to move gradually offshore, sinking along the permanent pycnocline which slopes up to near the surface during upwelling. The modified upwelled water is warmer (but more saline), contains more scatterers than water of similar densities offshore, and thus appears as a thermal and optical inversion. The turbidity maximum was observed to persist after the temperature inversion disappeared, which would indicate that the circulation pattern remains even when insufficient heat is absorbed by the upwelled water to generate a thermal inversion. (Knapp-USGS)

PHYTOPLANKTON NUTRIENTS IN ESTUARIES,
Woods Hole Oceanographic Institution, Mass.
Bostwick H. Ketchum.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 329-335, 1967. 7 p, 10 fig, 1 tab, 12 ref. Contracts AT (30-1)-1918 (AEC), and No 2196 (ONR).

Descriptors: *Nutrients, *Estuaries, *Eutrophication, Phosphorus, Water pollution, Salinity, Rivers, Phytoplankton, Sea water, Brackish water, Mixing.
Identifiers: Juan de Fuca Strait, New York Bight.

Estuaries can be enriched in nutrients by river waters, pollution, or sea water. Local enrichment of estuaries by rivers may be important, but it appears that this source cannot usually be invoked to explain productivity. The Strait of Juan de Fuca is cited as an example of nutrient enrichment due to sea water drawn from depths below the euphotic zone. In this zone, the concentration of nutrients has not been depleted by the growth of phytoplankton. Total phosphorus and salinity were used to identify 3 different sources of water in the New York Bight. The 3 types of water are: (1) Brackish river water with 30 ppt salinity; (2) surface coastal water with 30.95 ppt and (3) deep ocean water with 34 ppt salinity. In addition to the type of water, the population of phytoplankton will depend on factors such as grazing, the stability of the water column, the presence of vitamins or inhibitors in the water, and water transparency. ESTUARINE RESEARCH IN THE DANISH MORAINE ARCHIPELAGO,
Copenhagen Univ. (Denmark). Geographical Lab.
Axel Schow.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 129-145, 1967. 17 p, 23 fig, 33 ref.

Descriptors: *Estuaries, *Research and development, Tidal effects, Glaciation, Channels, Sediments, Sedimentation rates, Salt marshes, Land reclamation.
Identifiers: *Denmark, *Jutland Peninsula, Danish Moraine Archipelogo.

Tidal environment in Denmark is discussed,including the glacio-geomorphological characteristics, marine activity, tidal flats and tidal channels of the Danish Archipelago. Results of research programs in erosional forms (tidal creeks and tidal channels), rate of sedimentation, and accumulation forms (tidal flats and salt marshes) are discussed. Estuarine research is used as a basis for land reclamation and study of the paleogeography of the Danish estuary region. Denmark is an archipelago in the strictest sense and its land is strongly dissected by water. Typical estuarine conditions occur only on the southwest shoreline of the Jutland Peninsula. (Carstea-USGS)
W70-04995

CONCENTRATIONS OF MINOR ELEMENTS IN DIATOMACEOUS SEDIMENTS OF A STAGNANT FJORD,
Washington Univ., Seattle. Dept. of Oceanography.
M. Grant Gross.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 273-282, 1967. 10 p, 10 fig, 3 tab, 36 ref.

Descriptors: *Trace elements, *Sediments, *Sedimentation, *Fjords, Inlets (Waterways), Diatoms, Sulfides, Sea water, Sediment-water interfaces, Elements (Chemical).
Identifiers: *Canada, *Saanich Inlet, *British Columbia, Stagnant Fjords.

The concentration of a minor element in sediments of Saanich Inlets, British Columbia, depends on the concentration of the elements in the lithogenous and biogenous sources of bottom sediments and in the sulfide-bearing water. Sc, Y, Ti, Zr, V, Cr, Mn, Fe, Co, Ni, Cu, Zn, Ga, and Pb were associated primarily with the lithogenous constituents. The concentration of Mo increases in deposited sediments and is probably coprecipitated with iron sulfides from sea water near the water-sediment interface. The concentrations of other minor elements in the sediments did not change greatly. (Carstea-USGS)
W70-04996

SOME ASPECTS OF THE DYNAMICS OF CIRCULATION IN FJORDS,
Washington Univ., Seattle. Dept. of Oceanography.
Maurice Rattray, Jr.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 52-62, 1967. 11 p, 21 fig, 11 ref.

Descriptors: *Water circulation, *Fjords, Salt balance, Pressure, Bathymetry, Estuaries, Equations, Diffusion, Advection.
Identifiers: *Strait of Georgia, *Strait of Juan de Fuca, San Juan Channels.

Dynamic balance and salt balance were used to describe water circulation in fjords. In most cases, the balance of forces is given by the equality of the

horizontal pressure gradient and the vertical gradient of turbulent stress. The exceptions occur when the horizontal acceleration terms become important in the upper circulation, or because of bathymetric effects. Upper circulation is the unique feature of fjords which separates them dynamically from other estuarine systems. The salt-balance equation represents a balance between horizontal advection and diffusion over the sills; a balance between vertical diffusion, and possible time changes in the deep circulation; and between advection and vertical diffusion in the near-surface circulation. Examples are given to illustrate the dynamic balance which exists for a wide range of fjord conditions. An approximate similarity solution, given for the circulation in the upper layers of a fjord, provides a good representation of all the important features of this circulation. (Carstea-USGS)
W70-04997

THE ONTOGENY OF A SALT MARSH ESTUARY,
Woods Hole Oceanographic Institution, Mass.
Alfred C. Redfield.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 108-114, 1967. 7 p, 6 fig, 1 tab, 13 ref. NSF Contract GP 2042.

Descriptors: *Estuaries, *Salt marshes, *Sedimentation, Sediments, Radioactive dating, Carbon radioisotopes, Dating, High water mark, Sea level, Sedimentary structures, Channels, Meanders.
Identifiers: *Salt marsh estuary, Sand spits.

The history of the development of a typical New England salt marsh (Sandy Neck, Mass), and of the estuary which it now occupies is reconstructed. The depth of peat decreases progressively eastward along the south side of Sandy Neck. Relief similar to that of the adjacent upland is suggested by the contours along the upland margin of the marsh, whereas the relief is relatively low in the central part. A series of cores was collected across the marsh from the upland to one of the major creeks to examine the relation of high marsh peat, intertidal peat, and composition of the substratum. Carbon-14 dating was used to establish the time at which mean high water reached any given elevation as sea level rose. The sand spit has grown eastward during a period of about 4,000 years. The development of marsh along the margin of the sand spit proceeded more slowly because the basin deepened with distance from the upland and more time was required for sedimentation to reduce its depth. High marsh has now extended to the margin of meandering channels and the creeks now are in quasi-equilibrium with the hydraulic forces. (Carstea-USGS)
W70-04998

SALINITY MEASUREMENTS IN ESTUARIES,
Swarthmore Coll., Pa. Dept. of Physics, and Woods Hole Oceanographic Institution, Mass.
Paul C. Mangelsdorf, Jr.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 71-79, 1967. 9 p, 6 fig, 24 ref.

Descriptors: *Salinity, *Estuaries, Mixing, Tracers, Ecology, Instrumentation, Electrical conductance, Analytical techniques, Specific gravity, Electrodes, Membranes, Ion exchange.
Identifiers: Estuarine salinity determinations.

Salinity measurements in estuaries can be used for: (1) Studies of transport, flushing and mixing; (2) a tracer to label different water masses; (3) ecological factors, and (4) water uses for the streams flowing into an estuary. Salinity can be measured by determination of the electrical conductivity of water. Conductivity meters, chlorinity titrations, specific gravity methods, refractive index, selective electrodes, sodium electrode, and ion-exchange membrane electrodes are used to determine salinity. (Carstea-USGS)
W70-04999

EPHEMERAL ESTUARIES OF THE DELTAIC ENVIRONMENT,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
James P. Morgan.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 115-120, 1967. 6 p, 8 fig, 19 ref.

Descriptors: *Estuaries, *Deltas, *Quaternary period, Rivers, Land subsidence, Channels, Sea level, Sedimentation, Ocean waves, Tidal energy, Tidal waters, Coasts.
Identifiers: Mississippi Delta, Ganges-Brahmaputra, Deltaic estuaries, Interdeltaic estuaries, Estuarine tidal channels.

The Quaternary history of river mouths is discussed. The physiography of a deltaic area is the product of fluvial deposition and coastal erosion as influenced by the predeltaic topography. Three distinct deltaic estuarine types are, deltaic estuaries, interdeltaic estuaries, and estuarine tidal channels. Illustrations were selected from the Mississippi Delta (a low-tide and low-energy environment) and the high-tide regime of the Ganges-Brahmaputra system. Deltaic estuaries are a product of the delicate balance between variations in sea level, coastal progradation through sedimentation, and coastal retreat under wave attack. Estuarine morphology of the deltaic environment is subject to rapid modification and, from the standpoint of geologic time, deltaic estuaries are ephemeral in nature. (Carstea-USGS)
W70-05000

REGIONAL GEOMORPHOLOGICAL CHARACTERISTICS OF SOME AUSTRALIAN ESTUARIES,
Australian National Univ. (Canberra).
J. N. Jennings, and E. C. F. Bird.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 121-128, 1967. 8 p, 10 fig, 33 ref.

Descriptors: Estuaries, *Geomorphology, *Sedimentation, River flow, Tides, Sediments, Mineralogy, Sands, Beach erosion, Dunes, Sedimentary structures, Runoff, Bays, Barriers.
Identifiers: Australia, Estuarine geomorphology.

The estuarine geomorphology of Australia is discussed in terms of: (1) river flow; (2) wave energy; (3) tides; (4) sedimentation processes; (5) mineralogy of beach sands and lithology of dunes; and (6) neotectonic effects. Due to aridity, the Australian rivers generally have low runoff coefficients and only few have perennial flow. Extensive barriers have been built up at the river mouths along the coast of Australia from Shark Bay in Western Australia southward to Cape Leeuwin, eastward to Cape Howe, and northward to Fraser Island in Queensland. This coast is characterized by a high wave energy. The tropical coasts are subject to less persistently energetic wave regimes. The high wave energy coasts have low to moderate tidal ranges whereas the tropical coasts are subject to tides of moderate or high ranges. Sedimentation is influenced by biotic factors of salt marshes, mangrove swamps, and reed swamps. (Carstea-USGS)

SOME FEATURES OF THE HYDROGRAPHY OF NORWEGIAN FJORDS,
Bergen Univ. (Norway). Inst. of Geography.
Odd H. Saelen.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 63-70, 1967. 8 p, 14 fig, 3 ref.

Descriptors: *Fjords, *Hydrography, Glaciation, Salinity, Stratification, Density, Water circulation, Currents (Water), Fresh water, Brackish water
Identifiers: *Norwegian fjords, Sognefjord, Hardangerfjord.

The length of Norwegian fjords varies from a few kilometers up to the 176 km of Sognefjord. Aside from being the largest, this fjord is also the deepest with a maximum depth of nearly 1,300 m. Most of the Norwegian fjords do not exceed 600 m. Most fjords have 2 water layers. The upper layer has low salinity and density; the lower layer has high salinity and density. This stratification varies seasonally and it is most pronounced during summer. The two main features of fjord circulation are currents connected with fresh water supply and movements in the deeper layer. (Carstea-USGS)
W70-05003

CIRCULATION AND DIFFUSION,
Liverpool Univ. (England). Dept. of Oceanography.
K. F. Bowden.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 15-36, 1967. 22 p, 10 fig, 3 tab, 68 ref.

Descriptors: *Water circulation, *Diffusion, *Estuaries, Saline water intrusion, Mixing, River flow, Flow, Coriolis force, Model studies, Diffusivity, Salinity, Fjords.
Identifiers: *Estuarine circulation.

Estuarine circulation types include salt wedge, two-layer flow with entrainment, two-layer flow with vertical mixing, vertically homogeneous (with lateral variation and laterally homogeneous), and intensive mixing. Interaction between the river flow and tidal currents is influenced by the physical dimensions of the estuary and by the Coriolis force. The basic principles of circulation and mixing are briefly summarized. Flushing time, two-layer models, tidal prism and segmentation methods, mixing length theory, effective horizontal diffusivity, and other methods have been devised for computing the rate at which river water is flushed out of an estuary. Diffusion problems and wind effects on estuarine circulation are discussed. Water movements, mixing processes, and the distribution of salinity which results from their combined action are the main physical problems to be investigated in an estuary. (Carstea-USGS)

SEDIMENTARY PATTERNS OF MICROFAUNA IN A COASTAL PLAIN ESTUARY,
Virginia Inst. of Marine Science, Gloucester Point; and Virginia Univ., Charlottesville. Dept. of Geology.
M. M. Nichols, and R. L. Ellison.
NSF Grant G20443. In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 283-288, 1967. 6 p, 6 fig, 2 tab, 10 ref.

Descriptors: *Estuaries, *Sediments, *Sedimentation, *Aquatic microorganisms, Microorganisms, Coastal plains, Marshes, Aquatic life, Rivers, Fresh water, Shoals, Sedimentation rates, Brackish water.
Identifiers: *Rappahannock Estuary, Foraminifera, Ostracoda.

Core samples were taken of surface sediments from 148 stations in waters and marshes of the Rappahannock Estuary in northeastern Virginia. The sedimentary Foraminifera, Ostracoda, and Thecamoebina were studied. Different types of estuarine waters appear to determine the patterns of microfauna. The river subfacies containing Thecamoebina are found in the freshened part of the estuary; arenaceous Foraminifera are found in the shoal subfacies; the lower, deeper water of the estuary is inhabited by the basin subfacies of calcareous Foraminifera. Standing crops of Foraminifera may change in size and position from year to year. The ratios of living specimens of Foraminifera to total tests showed little relationship to the sedimentation rates. Comparison with other areas is discussed. (Carstea-USGS)

QUANTITATIVE RESEARCH ON LITTORAL DRIFT AND TIDAL INLETS,
Florida Univ., Gainesville. Coastal Engineering Lab.
J. A. Battjes.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, - 185-190, 1967. 6 p, 3 fig, 1 tab, 5 ref.

Descriptors: *Littoral drift, *Sediment transport, Research and development, Inlets (Waterways), Sands, Tracers, Tracking techniques, Aerial photography, Ocean waves, Currents (Water).
Identifiers: Coastal sedimentation.

Longshore sand drift, sand transport through inlets and stability of inlets are discussed quantitatively. Littoral drift is measured in the field and laboratory by fluorescent tracer and aerial photography methods. Aerial photography of several wave lengths of the migrating sand waves gives simultaneous quantitative data over an extended area and shows patterns and details. The laboratory equipments are carried out in tanks and the effects of both waves and currents on sediment transport are studied. The three kinds of inlet stability are bypassing stability, location stability and cross-sectional stability. (Carstea-USGS)
W70-05011

RATES OF SEDIMENT ACCUMULATION IN MODERN ESTUARIES,
Miami Univ., Fla. Inst. of Marine Science.
Gene A. Rusnak.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 180-184, 1967. 5 p, 5 fig, 20 ref.

Descriptors: *Sedimentation rates, *Sediments, *Estuaries, Deposition (Sediments), Environment, Continental shelf, Continental slope, Deep water, Rivers, Provenance, Lagoons, Bays, Climates, Arid climates, Humid climates.
Identifiers: Estuarine sedimentation.

The four broad environmental categories of marine sedimentation are: (1) The marginal marine environment containing estuaries; (2) the continental shelf; (3) the continental slope; and (4) the deep sea. Positive-filled estuaries are those that are filled entirely by river-transported sediment inflow. Inverse-filled estuaries are those that are filled solely or to the largest extent by sediments entering the estuary from the sea. Redistribution of basin sediment from local shoreline margins within the basin can be considered as neutral-filled (non-filling) basins. The rate of sediment accumulation in a basin is dependent upon source of supply, geographic position, and climate. The best estimates for accumulation rates are 2 m per thousand years for humid bays and estuaries, and 1 m per thousand years for arid and semi-arid lagoons. (Carstea-USGS)
W70-05012

ORIGIN OF SEDIMENTS IN ESTUARIES,
Paris Univ. (France). Institut de Geographie.
Andre Guilcher.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 149-157, 1967. 9 p, 12 fig, 37 ref.

Descriptors: *Sediments, *Provenance, *Estuaries, Sediment discharge, Suspended load, Deltas, Rivers, Slopes, Deposition (Sediments), Sediment transport, River beds, Tidal waters.
Identifiers: Estuarine sedimentation.

A possible source of estuarine sedimentation differences may be the quantitative contrasts in discharge of solid materials by rivers. Fine material eroded from the slopes of estuaries can take the place of sediments coming from upstream when river discharge is insignificant. Water motion within the estuary must also be taken into account. The penetration of marine sediments into estuaries can be due to the wedge of salt water flowing upstream along the bottom. In some estuaries, a motionless lens of water persists near the bottom during a large part of the tidal period. The position and duration of this motionless water body varies with the river discharge and tidal range. The lens acts as a weir in which the coarse particles flowing along the bottom are trapped, whereas the finer elements flowing in suspension in the upper water layer pass over it. If the lens is located near the mouth of the river, a delta can be built; but if it is located far upstream, the fluvial sediments settle before they reach the middle and lower parts of the estuary. (Carstea-USGS)
W70-05013

WHAT IS AN ESTUARY: PHYSICAL VIEW POINT,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
Donald W. Pritchard.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 3-5, 1967. 3 p.

Descriptors: *Estuaries, *Classification, *Tidal waters, Salinity, Mixing, Water circulation, Bays, Fjords, Rivers, Valleys, Water chemistry, Barriers, Sedimentary structures, Density.
Identifiers: Definition of estuaries, Classification of estuaries.

A definition of an estuary should recognize certain basic similarities in the distribution of salinity and density. The circulation pattern, mixing processes and the importance of boundaries which control the distribution of physicochemical properties in an estuary should also be considered. A definition is given which takes into account these considerations. This definition is widely recognized. Based on geomorphological considerations, estuaries are classified into 4 primary groups: (1) drowned river valley; (2) fjord-type estuaries; (3) bar-built estuaries; and (4) estuaries produced by tectonic processes. Each one of these categories is briefly discussed and examples are provided. (Carstea-USGS)
W70-05014

ESTUARIES: ANALYSIS OF DEFINITIONS AND BIOLOGICAL CONSIDERATIONS,
Hamburg Univ. (West Germany). Museum of Zoology.
Hubert Caspers.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p6-8, 1967. 3 p, 18 ref.

Descriptors: *Estuaries, *Lagoons, *Biological properties, *Water chemistry, Tidal waters, Fresh water, Inflow, Sea water, Biota, Boundaries (Surfaces), Mixing.
Identifiers: Poikilohalinity.

The definitions of estuaries given by Emery and Stevenson, Ketchum, and Pritchard are critically analyzed. Instability of salinity is suggested as a distinguishing factor between lagoons and estuaries. A stable body of brackish water may be considered a lagoon whereas an estuary is characterized by an unstable mixing of fresh and marine waters. The unstable conditions of estuaries determines their principal biological features. The main characteristics of estuaries are: (1) They are limited to river mouths in tidal seas; (2) the extent of saline areas in estuaries depends on the amount of fresh water inflow; (3) estuaries are characterized by instability of environmental factors and poikilohalinity. Examples of flora and fauna of an estuary are presented. (Carstea-USGS)

Woods Hole Oceanographic Institution, Mass.
K. O. Emery.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 9-11, 1967. 3 p, 1 fig.

Descriptors: *Estuaries, *Lagoons, *Continental shelf, Sediments, Sea level, Sedimentary structures, Sands, Deposition (Sediments), Sediment transport, Radioactive dating, Sedimentation rates, Pleistocene epoch.
Identifiers: Sand ridges, Sea level rise.

This paper discusses the regional aspects of estuaries and lagoons, describes the continental shelves, and examines the sea level variations during the pleistocene epoch. Postglacial rise of sea level developed estuaries near the shelf-break, lagoons on the outer half, lagoons and estuaries near the middle, and estuaries on the nearshore part of many continental shelves. Continued rise of sea level allowed the sands to cover the shelf to the highest level of the sea. After reaching this stage, the sands will prograde back across the shelf as a succession of seaward-growing sand ridges, and perhaps offshore bars and barrier islands of lagoons. Radiocarbon dating of shallow-water shells indicates a rise of sea level from about minus 100 m 18,000 years ago to minus 20 m 9000 years ago. The rate decreased steadly from 9 m to 3 m per thousand years. (Carstea-USGS)

SALT BALANCE AND CIRCULATION IN PARTIALLY MIXED ESTUARIES,
Washington Univ., Seattle. Dept. of Oceanography.
Donald V. Hansen.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 45-51, 1967. 7 p, 11 fig, 14 ref. Grants G19788 and GP1101. NSF Contracts Nonr 477 (10) and Nonr 477 (37). Project NR 083 012.

Descriptors: *Salt balance, *Estuaries, *Mixing, *Water circulation, Salinity, Theoretical analysis, Tidal waters, Wind tides, Wind pressure, River flow, Discharge (Water).

Identifiers: Rayleigh number, Tidal mixing, Partially mixed estuaries.

The kinematics of the mean salinity distribution and the circulation in partially mixed estuaries are discussed. Similarity and non-similarity solutions with exponential and constant salinity gradients are given. The theoretical results are in agreement with observations of river discharge, tidal mixing, width, and depth. Velocity profiles in estuaries cannot be inferred precisely from the salinity distribution alone. The nature of the velocity profile depends upon an estuarine counterpart of the Rayleigh number and this number can be determined if mean wind stress, the mean velocity at a single depth, and the river discharge are known. (Carstea-USGS)

SEDIMENT TRANSPORT AND SEDIMENTATION IN THE ESTUARINE ENVIRONMENT,
Netherlands Inst. for Sea Research, Den Helder.
H. Postma.
In: Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 158-179, 1967. 22 p, 24 fig, 3 tab, 59 ref.

Descriptors: *Sediment transport, *Sedimentation, *Estuaries, Environment, Tidal waters, Erosion, Scour, Deposition (Sediments), Suspended load, Turbidity, Water circulation.
Identifiers: *Estuarine sedimentation, Scour lag effects, Settling lag effects.

Sediment movement and sedimentation in nearshore waters, tidal flats, and estuaries are reviewed. The main topics discussed are: (1) Erosion, transportation and deposition; (2) flocculation and deflocculation; (3) transport of suspended matter by tidal currents; (4) transport of suspended matter in estuarine circulation systems; and (5) bottom sediments. Some of the accumulation mechanisms which retain suspended matter near the coast are settling and scour lag effects. Density differences which occur in and near rivers may result in the concentration of suspended materials in turbidity maxima. Flocculation promotes the retention and sedimentation of fine-grained sediments. (Carstea-USGS)

FRESH WATER SUPPLIES THROUGH DESALINATION,
Department of the Interior, Washington, D.C.
Chung-Ming Wong.
Water Wastes Eng, Vol 6, No 11, p F-7-F-9, Nov 1969. 3 p, 3 photo.

Descriptors: *Deslaination, *Demineralization, Fresh water, Sea water, Water costs, Brackish water, Potable water, Brines, Technology, Electric power production, Nuclear powerplants, Water supply, Multiple purpose, Distillation, Corrosion, Membrane processes, Economics.
Identifiers: Cost savings, Multistage flash distill, Corrosion resistant alloys.

With the seas offering an unlimited source of water, many convincing arguments are presented for desalination. Desalting provides an entirely new source of high-quality water for needs as they arise. Potable water can be manufactured at locations and in time frames of man's own choosing without depending on the whims of nature. Desalting plants can be located in or near areas of greatest need to produce fresh water and, in some cases, electricity in a joint nuclear-powered operation. Other types of plants, using water of far less salinity than sea water, can provide modest additions to the water supply for small- and medium-sized urban areas at a pace easily adjusted to growth. Technical advances, materials development, and cost reduction that have occurred in desalination processes since 1952 are discussed. (USBR)

EVAPORATIVE FREEZING PROCESS FOR WATER DESALINATION,
Catholic Univ. of America, Washington, D.C.
H. M. Curran, and C. P. Howard.
Office of Saline Water Research and Development Progress Report No. 511, 1969. 95 p, OSW Contract 14-01-0001-1266.

Descriptors: *Freezing, Desalination Processes, Evaporation, Melting, *Salinity.
Identifiers: *Evaporative Freezing, Washing, *Batch desalination process.

A batch-type evaporative freezing process was evaluated at the bench-scale level. Saline water is sprayed into a rotating cylindrical basket at a pressure below the triple-point pressure. Removal of vapor results in formation of a semi-solid layer of ice on the later surface of the basket. The entrained brine is removed by washing and the residual ice is melted. The optimum design requires that freezing, washing and melting steps be of equal duration, and the optimum plant consists of three modules, in each of which freezing, washing and melting steps be of equal duration, and the optimum plant consists of three modules, in each of which freezing, washing, and melting operations occur in succession and out-of-phase with the other two. The heat removed by evaporative freezing in one module is used to melt the washed ice in another module. The minimum energy consumption is estimated to be 50 to 60 KWH per 1000 gallons of product at a 50 per cent conversion. Because of the amount of energy required and the complexity of the equipment the economic feasibility of the process is questionable. (Rinne-Office of Saline Water)

SURVEY OF CONDENSER TUBE LIFE IN SALT WATER SERVICE,
Little (Arthur D.), Inc., Cambridge, Mass.
E. H. Newton, and J. D. Birkett.
OSW R and D Progr. Rept. No. 278, Aug. 1967. 71 p, 11 fig, 11 tables.
Identifiers: *Condensers, *Copper alloys, *Tubing (Metal), Cathodic projection, Equipment failures, Iron alloys, Maintenance, Operating experience, OSW sponsored, PH adjustment, Protective coatings, Scale removal, Stainless steels, Water flow.

Results are presented of survey of 56 coastal power plants using various heat-exchanger tube materials and seawater for cooling. Data were obtained on 237 tube sets of 8 different alloys. Total of 1,778,000 tubes was involved. A table summarizes results for 6 more commonly used materials based upon percent probability of tubes lasting x years with no more than y percent tubes failed.

SOME PRACTICAL ASPECTS OF DESALINATION BY EVAPORATION,
J. M. Stewart.
Proc. 1st Intern. Symp. Water Desalination, Wash, 1965, p 651-74, 1967. 6 fig, 9 ref.
Identifiers: *Corrosion control, *Distillation processes, *Evaporators, Brine flow, Feedwater treatment, Heat transfer coefficient, Pumps, Scale prevention, Tubing (Metal).

Distillation plants may be classified in 6 groups (1) domestic supply, (2) boiler feed and chemical processes, (3) private supply, (4) emergency supply, (5) marine use, (6) agricultural. Each group has its own set of criteria with regard to size, cost, and dependability. However, some general limitations as to size or capacity can be set out. (1) Heat transfer coefficients are effectively in the range of 450 to 550 btu/hr sq ft deg F. (2) There is a maximum useful size for the brine recirculating pump. (3) To keep the plant within practical physical limits, the brine circulation is limited to about 1 million lb/hr ft of width of evaporator shell. (4) Tubes are probably limited to 80 ft of 1-in. od tubing. (5) Brine temperature is limited to 250 deg F with acid feedwater treatment. There is much development work to be done before plants in excess of 10 mgd can be a commercial proposition.
W70-04657

ANALYSIS OF DIFFERENT DESIGNS OF DISTILLATION DESALINATION,
S. I. Golub, V. B. Chernozubov, E. A. Sobolev, and M. B. Weisblatt.
Proc. 1st Intern. Symp. Water Desalination, Wash, 1965, p 515-25, 1967. 3 fig, 3 tab, Paper SWD/79
Identifiers: *Distillation processes, *Flash evaporation, *Multiple effect distillation, *Multistage flash distillation, Operating costs.

By analyzing multistage installations for flash evaporation and multiple effect evaporators being operated in the USSR, the product was found to cost more (5 to 8 kopecks) by flash evaporation than by multiple effect evaporation. Three reasons are given for this. (1) In a flash installation, in order to create good heat transfer at the heater-condensers, the total amount of water to be evaporated must be pumped through at a high-rate, which leads to extensive use of electric power and to a unit cost 2 to 3 kopecks more than that with multiunit equipment. (2) An increase of 1 to 1.5 kopecks must be added to the flash installation because of the acid treatment to feedwater to prevent scale formation, and (3) an increase in cost is realized for the flash process because of the larger heating surface. Flash evaporation and natural circulation evaporators have a high operational reliability. Descending film and circulation pumps require constant servicing and overhauling.
W70-04658

DEAERATORS FOR DESALINATION PLANTS.
Oak Ridge National Lab., Tenn.

OSW R and D Progr. Rept. No. 314, Dec. 1967. 117 p, 27 fig, 83 ref.
Identifiers: *Carbon dioxide removal, *Deaeration, *Deaerators, Carbon dioxide analysis, Columns (Process), Corrosion control, Fouling, Freeport plant, Oxygen analysis.

An interim report on the deaerator study is presented outlining the state-of-the-art information on existing deaerators, research and test work performed by OSW contractors and availability of commercial deaerators. Technical literature survey revealed very little information on mass transfer technology related to problems of designing deaerators for seawater. Experimental work by M. W. Kellogg Co. has attempted to evaluate conventional two-phase exchange technology to seawater. Recommendations are made to undertake a test program to evaluate the performance of the most promising deaeration methods.

CURRENT AND PROJECTED TECHNOLOGY OF FLASH TYPE SEA WATER DESALTING PLANTS,
Aqua-Chem, Inc., Milwaukee, Wis.
A. B. Steinbruchel.
Preprint SM-113/29 of Paper Presented at IAEA Symp. Nucl. Desalination, Madrid, Spain, Nov. 18-22, 1968. 12 p, 4 fig.
Identifiers: *Clair Engle plant, *Flash evaporation, *Scale prevention, Brine concentration patio,

Component designs, Corrosion control, Feedwater treatment, Flowsheets, Performance ratio.

Designed and built by Aqua-Chem, Inc., the Clair Engle multistage multieffect flash plant at San Diego, with 3 recycle effects and 68 stages, is operating at a performance ratio better than 20 to 1, a 50% higher gain ratio than any other plant in the world. Guaranteed to operate and produce 1 MGD with a maximum brine temperature of 250 deg F, the equipment is designed for future operation with brine temperatures up to 290 deg F, increasing capacity to 1.23 MGD. Devised primarily to avoid calcium sulfate scaling conditions over a wide range of temperatures while minimizing feedwater quantity and treatment costs, the MEMS process permits operation of the flash plant at both higher brine terminal temperature and higher final brine concentration than other flash evaporator systems. To control and minimize corrosion of evaporator materials the plant operates with a two-stage atmospheric degasification followed by a vacuum deaeration system to liberate corrosive gases from acidified seawater. Flow schemes, plant auxiliary systems, and components are described in detail.
W70-04660

DESIGN AND COST OF ION-EXCHANGE SOFTENING FOR A 50-MGD SEAWATER EVAPORATION PLANT,
California Univ., Berkeley.
G. Klein, K. M. Makar, B. W. Tleimat, and T. Vermeulen.
Sea Water Conversion Lab. Rept. No. 68-2 (Water Resources Center Desalination Report No. 25), September 1968. 59 p, 12 fig, 10 tables, 31 ref.
Identifiers: *Freedwater treatment, *Removal from feedwater, Calcium, *Scale prevention, Capitalized costs, Conceptual designs, Concrete construction, Demineralizers, Ion exchangers, Ion exhanging.

Ion exchange is used for the removal of calcium from seawater, followed by acidification and deaeration to eliminate carbonate ions. Regeneration of the ion-exchange bed is accomplished by using only the reject brine from the evaporator, the brine being concentrated in the evaporation to four times the salinity of seawater. The capital cost of the installation is minimized by assuming the use of open reinforced-concrete tanks, rather than closed steel tanks, for the ion-exchange beds. The designs of the ion-exchange installation and of its operating cycle are based on a body of pertinent experimental data obtained previously in this laboratory. The design study has resulted in an estimated cost for calcium removal of 3.6 or 3.8 cents/1000 gal of product from the evaporator, based on respective interest rates of 3.125 or 4.125% on the depreciated plant investment. Since this pretreatment leads to more economic distillation conditions, the attendant savings should largely offset the costs of pretreatment.

DYNAMICS EXPERIMENTS ON THE AMF MILLSTONE POINT FLASH EVAPORATOR,
Oak Ridge National Lab., Tenn.
S. J. Ball, N. E. Clapp, B. Squires, and R. Van Winkle.
ORNL-TM-2188, July 8, 1968. 69 p, 37 fig, 25 ref.
Identifiers: *Multistage flash distillation, *Plant dynamics, AEC sponsored, Dynamic response, Exerimental data, Frequency response, Instrumentation, Mathematical models.

Dynamics experiments were performed on the three-stage AMF flash evaporation at Millstone Point, Conn., in June 1967 to verify theoretical calculations of large MSF plant dynamic behavior. Frequency response tests were run at operating temperatures between 100 and 140 deg F, tray-brine flowrates between 400,000 and 700,000 lb/hr per foot of width, and with both plain and baffled interstage orifice designs. Pseudorandom binary sequences were used as input perturbation signals for the recirculating brine and brine heater steam flow control valves. The measured results indicate that the fixed-coefficient, single-phase flow orifice equation is inadequate for describing transient interstage orifice flowrates. Improved models were derived for the tray brine vaporization rate and flow dynamics. The scope of the experiments was reduced due to equipment difficulties and to excessively large inherent temperature fluctuations under certain operating conditions.

NUCLEAR DESALINATION PLANT DYNAMICS - MODELING AND ANALYSIS OF A MULTISTAGE FLASH EVAPORATOR,
Tennessee Univ., Knoxville.
T. W. Kerlin, J. W. Prados, W. C. Wright, and E. L. Mohundro.
Neut-2906-2, July 1968. 30 p, 11 fig, 7 ref.
Identifiers: *Evaporation dynamics, *Mathematical models, *Multistage flash distillation, Flow distribution, Fluid dynamics, Stability analysis.

Progress is reported in developing mathematical models for describing tray brine flow in an MSF stage. A scale model of a 5-stage test chamber was constructed, and proposed test procedures and equipment are described. A mathematical model for two-region brine-tray liquid flow is developed, and theoretical results are presented. A summary is given of a method for computing the linear stability of very large systems, with application to a large MSF plant. A detailed description is in NEUT-2806-3 (see abstract 30-00657).
W70-04663

PROBLEMS IN DESIGN AND RESEARCH ON CONDENSERS OF VAPORS AND VAPOR MIXTURES,
Delaware Univ., Newark.
A. P. Colburn.
Inst. Mech. Engrs., London, Proc, Vol. 164, p 448-58, 1951. 14 fig, 36 ref.
Identifiers: *Condensing , *Evaporator system design, *Evaporator-condenser system designs, *Heat transfer, Design, Design data, Feedwater heating, Film condensation, Mass transfer.

The theoretical background is outlined for condensation of pure and mixed vapors under conditions of a film-type condensate. The effect of vapor velocity is important for both pure vapors and those mixed with noncondensable gases. On the basis of the fundamental mechanism of condensation involved, approximation procedures are developed which are useful as quick methods of estimating and rough checking. It is concluded that there is great need for testing theoretical and approximate methods against full-scale performance data.
W70-04664

AN INVESTIGATION ON THE DISTILLATION OF BRINE BY VERTICAL TUBE EVAPORATION UTILIZING THE SEPHTON FLASH TUBE (VORTEX TUBE) PROCESS,
California Univ., Berkeley.
H. H. Sephton.
OSW R and D Progr. Rept. No. 361, June 1968. 44 p, 22 fig.
Identifiers: *Falling film evaporation, *Twisted tapes, Flow control, Heat transfer improvements, Proprietary process.

Design and construction of a vertical tube evaporator (VTE) test facility, capable of testing pairs of distillation tubes of 1- to 3-in. diameter and up to 24 ft in length is described. A novel, proprietary vortex tube process for fluid flow control as applied to falling film flash evaporation and to vertical tube distillation by utilizing a helical insert narrower in width than the internal diameter of such tubes is reported. Heat flux gains of 20 to 80% were obtained with a vortex tube over those obtained with a reference tube, tested simultaneously under equal VTE process conditions with water having 0 to 10% sodium chloride added thereto as the distilland, in vertical copper distillation tubes of 2-in. x 20 ft dimensions.
W70-04665

DEVELOPMENT OF TECHNOLOGY APPLICABLE TO 50 MGD AND LARGER SEAWATER DISTILLATION PLANTS,
Office of Saline Water, Washington, D.C.; and Oak Ridge National Lab., Tenn.
E. N. Sieder, and I. Spiewak.
Preprint SM-113/34 of Paper Presented at IAEA Symp. Nucl. Desalination, Madrid, Spain, Nov. 18-22, 1968. 20 p, 5 fig, 21 ref.
Identifiers: *Component development, *Component testing, *Heat transfer improvements, *Vertical tube evaporators, Brine flow, Component designs, Concrete construction, Deaerators, Entrainment, Extended heat transfer surfaces, Flash chambers, Freeport plant, Heat transfer coefficient, Heat transfer surfaces, Pilot plant operations, Product water treatment, Wrightsville Beach plant.

The San Diego Multistage Flash Module serves as a test bed for studying brine flows up to 1,000,000 lb/hr-ft width in full-scale flash chambers, hydraulics of a 77,000 GPM recycle pump, and heat transfer and venting of large condenser bundles. Low-cost evaporator tubing fabrication methods are being developed, and tubes up to 36 ft long have been fabricated and installed in a test fixture. Deaerator designs and instruments are being developed to reduce oxygen content of treated seawater to 10 ppb. Advanced technology developement is centered around high performance evaporator tubing, especially with the multieffect vertical tube evaporator process. Fluted tube bundles at Wrightsville Beach and Freeport are maintaining heat transfer coefficients 2 to 3 times higher than those of smooth tubes. A new spiral-indented tube provides heat transfer rates 1.5 to 2 times those of smooth tubes. Full size bundles of high performance tubes will be tested in a VTE component test vehicle to be built at San Diego. Concrete is especially promising as a structural material, as tests have indicated that it will withstand brine temperatures up to 250 deg F. Plastics are promising for coatings and for special parts such as hook-vane entrainment separators. Progress is also being made in large water-only plants. Design studies have been completed of large vapor compressors and of large VC plant designs.

DEVELOPMENT REPORT NO. 6, SALINE WATER CONVERSION DEMONSTRATION PLANT NO. 1, FREEPORT, TEXAS.
Stearns-Roger Corp., Denver, Colo.

OSW R and D Progr. Rept. No. 298, Sept. 1967. 53 p, 7 fig, 10 tables, 7 ref.
Identifiers: *Deaerators, *Feedwater treatment, *Multiple effect distillation, *Vertical tube evaporators.

The report covers an investigation of the various aspects of heat transfer and feedwater treatment and their effects on the multiple-effect long-tube-vertical evaporator. Development run no. 8 was conducted in a scale-free manner for almost two months with only one unscheduled shutdown of 1.5 hr. Production was maintained above 1 mgd with 69.5% of the originally installed heat transfer surface. Tests were completed which show that product heat recovery by flashing accumulated condensate is feasible, but the existing plant equipment imposes limitations on the maximum production rate in this mode of operation. A study of feed-

water acid addition rate to the deaerator-decarbonator showed that the quantity of acid used could be reduced about 15% without harm. Water was produced for 114.58 cents/1000 gal during the run. This value reflects a 2.69 cents/1000 gal penalty directly attributable to operating conditions imposed by the development program.
W70-04668

DEVELOPMENT REPORT NO. 7, SALINE WATER CONVERSION TEST BED PLANT, FREEPORT, TEXAS.
Stearns-Roger Corp., Denver, Colo.

OSW R and D Progr. Rept. No. 299, June 1968. 59 p, 17 tables, 10 fig.
Identifiers: *Deaerators, *Feedwater treatment, *Multiple effect distillation, *Vertical tube evaporators, Acid stabilization processes, Cathodic protection, Chemical additives, Corrosion control, Freeport plant, pH control, Pilot plant operations, Protective coatings, Removal from feedwater, Carbonate, Scale prevention, Status reports, Water costs actual.

The report covers an investigation of the various aspects of heat transfer and feedwater treatment and their effects on the multiple-effect long-tube-vertical evaporator. Development run no. 9 (June to Nov. 1965) consisted of over 4 months of operation with a total of 31 hours of shutdown time, and 2 of the 4 shutdowns were scheduled as part of the development program. Evaluation of test data indicates that plant insulation is deteriorating and that steam economy is suffering accordingly. Evaporator performance evaluations show that high operating temperatures and high brine flow rates enhance heat transfer coefficients. Investigation of tube side pressure drop in the evaporators has indicated that lost temperature potential due to delta p is a factor in the low pressure evaporators. It was proven that improper venting can limit the production capability of the plant and that venting adjacent effects to the atmosphere through a common line is not adequate. Water was produced for 111.93 cents/1000 gal during the run, a 3% improvement over run 8, due to higher production over a longer operating time.

RESEARCH AND DEVELOPMENT ON THE HORIZONTAL SPRAY FILM EVAPORATOR.
Aqua-Chem, Inc., Waukesha, Wis.

OSW R and D Progr. Rept. No. 209, Nov. 1966. 81 p, 33 fig, 9 ref.
Identifiers: *Dropwise condensation, *Heat transfer coefficient, *Horizontal tube evaporators, Scaling, Vapor compression evaporation.

Heat transfer coefficients on horizontal spray film evaporator were determined under a variety of operating conditions under laboratory and field operating conditions. Heat transfer coefficients were only slightly influenced by the heat and vapor velocity over the range of 3000 to 12000 btu/hr sq ft heat flux and 16.5 to 50 ft/sec average vapor velocity. Average heat transfer coefficients of 1125 and 2000 btu/hr sq ft deg F can be maintained for the 5/8-in.-copper-nickel bundle and copper bundle, respectively, on salt water without scaling for an extended period of time under vapor compression operation.
W70-04671

ANALYSIS OF THE ECONOMICS OF LARGE CAPACITY THERMAL DESALINATION PLANTS,
I. L. Sergeyenko.
Proc. 1st Intern. Symp. Water Desalination, Washington, 1965, p 373-88, 1967. 24 fig, Paper SWD/71.
Identifiers: *Distillation processes, *Multistage flash distillation, *Seeding processes, *Vertical tube evaporators, Direct contact heat exchange, Feedwater treatment, Flash evaporation.

The two main processes for large-scale distillation plants are vertical tube evaporation and multistage flash distillation (with either condenser tubes or contact condensation). Scale formation is a basic problem in any of the processes. In USSR the most economical scale prevention method is a seeding process. Numerous graphs are given to show the effect of the number of stages in a plant on the cost of product water for the different distillation processes.
W70-04672

AN EFFICIENT, COMPUTER-ORIENTED METHOD FOR STABILITY ANALYSIS OF LARGE MULTIVARIABLE SYSTEMS,
Tennessee Univ., Knoxville.
W. C. Wright, and T. W. Kerlin.
Ph.D. Thesis. Neut-2806-3, July 1968. 172 p, 27 fig, 88 ref.
Identifiers: *Multistage flash distillation, *Plant dynamics, *Reactor dynamics, AEC sponsored, Frequency response, Programs (Computers), Stability analysis.

The development and application of a technique is described for evaluating the stability of multivariable systems whose dynamics are given by up to 1000 first-order, linear differential equations. Time-lagged variables may be included in these equations. The technique is an analytical approach which operates on the coefficients of the equations that describe the system. The method is based upon a modification of the Mikhailov (Leonhard-Cremer) stability criterion and employs special programming techniques which take advantage of the form of the system equations. Among the systems analyzed for stability were the molten salt reactor experiment, a molten salt breeder reactor, and the evaporator, heater, and heat reject components of a multistage flash evaporator plant. Computer programs written in FORTRAN IV are included. The analysis of the multistage evaporator plant required about 1.5 hr on the IBM 360/75 computer.
W70-04673

CONCEPTUAL DESIGN STUDY OF A ONE MILLION GALLON PER DAY MSM DESALINATION PLANT - REPLACEMENT FOR DEMONSTRATION PLANT NO. 2 AT POINT LOMA, SAN DIEGO, CALIFORNIA.
Fluor Corp., Ltd. Los Angeles, Calif.

OSW R and D Progr. Rept. No. 252, Apr. 1967. 147 p, 28 fig.
Identifiers: *Conceptual designs, *Multiple effect distillation, Concrete construction, Construction costs, Deaeration, Design, Distillation processes, Feedwater treatment, Flash evaporation, Fossil fuels, Point Loma plant, Scale prevention, Seeding processes, Tube bundle design, 0-50 MGD plant.

Results are presented of a conceptual design study are presented for a 1.0-MGD multieffect flash plant at Point Loma. The design is essentially a 1/50th slice of an optimum conceptual 50-MGD plant and is intended to demonstrate major design features. The base plant (68 flash stages) operating temperature is 250 deg F, with flexibility to operate experimentally at 290 deg F. A special 1A effect, to operate independently, is provided to yield operating experience in the 290 to 350 deg F range. The design provides for study of brine flow path variations, measurement of instage temperatures and pressures, and study of concrete shell performance. The vertical height of the effect II and III tube bundles is representative of large-capacity plants. Acid treatment provides alkaline scale control. Auxiliary seeding, lime magcarbonate, and ion exchange systems provide sulfate scale control at extended operating conditions. Capital cost estimates (1965 basis) are $2,950,000 for the base plant, $225,000 for the 1A effect, and $1,170,000 for water treatment systems.
W70-04674

COST OF WATER FROM A SINGLE-PURPOSE MULTISTAGE FLASH PLANT WITH VAPOUR RECOMPRESSION.
Applied Research and Engineering Ltd., Durham (England).

IAEA Tech. Rept. Ser. No. 93, 1968. 73 p, 35 fig, 31 ref.
Identifiers: *Economic evaluations, *Energy sources, *Single-purpose plant economics, *Water costs estimate, Dual-purpose plant economics, Fossil fuels, Gas-cooled fast-breeder reactors, High-temperature gas-cooled reactors, Nuclear energy sources, Pressurized-water reactors, Single-purpose plant.

The cost of water from a single-purpose MSF/recompression plant is presented and compared with the cost of water from dual-purpose plant. It also shows the cost of water from a plant producing both water and power separately from a common reactor. It was found that for a single-purpose plant with recompression the estimated water costs ranged from 30 cents/1000 gal for a 350-MGD plant with a light-water reactor (at 6% charge rate) to 92 cents/1000 gal for a 70-MGD plant with a gas-cooled reactor (at 15% charge rate). Estimates are given for 70 and 350-MGD plants, 6 and 15% charge rates, and light-water reactors, fast reactors, gas-cooled reactors, high-pressure steam fossil plants, and low-pressure fossil plants. A direct comparison between the proposed system and a dual-purpose plant cannot be made because of the effect of the cost of electrical power on the water cost from a dual-purpose plant.

Chem. Eng. Prog. Vol. 61, No. 7, p 80-88, 1965. 12 fig, 15 ref.
Identifiers: *Falling film evaporation, *Freeport plant, *Vertical tube evaporators, Distillation processes, Feedwater heating, Heat exchangers, Heat transfer, Heat transfer improvement, Heat transfer surfaces, Multiple effect distillation, Pilot plant operations.

A description is given of the operation of various heat transfer units in the first OSW desalination demonstration plant (built 1960-61 at Freeport, Texas). The plant is of the long tube vertical (LTV)

falling-film type with forward feed and 12 evaporator effects. Boiler plant steam supplies heat in the first effect. Most of the feedwater evaporated in the first effect heats and evaporates the feedwater in the second effect evaporator, being condensed by this process, and the remainder is condensed as it gives up its heat to the incoming feedwater. The discharged brine from the first effect becomes the feed for the second effect. This process is repeated in 11 additional evaporator effects at progressively lower temperatures and pressures down to 115 deg F and 1.9 PSIA in the twelfth effect. The evaporated water from the last effect is condensed by heat exchange with seawater. For every pound of steam 11 lb of fresh water are produced. Electric power consumption is about 1 kw-hr/1000 lb of fresh water production. Total energy consumption is about 115 btu (thermal)/lb of water produced. Operating temperatures have been successfully increased to 278 deg F and overall plant temperature range to 160 deg F. Equivalent production rates of 180% of rated capacity have been demonstrated. Work is continuing with the anticipation of reaching and exceeding 300 deg F operation.

FLOW THROUGH IRRIGATED DUMPED PACKINGS--PRESSURE DROP, LOADING, FLOODING,
M. Leva.
Chem. Eng. Progr. Symp. Ser. , Vol. 50, No. 10, p 51-59, 1954. 10 fig, 21 ref.
Identifiers: *Columns (Process), *Deaeration, *Deaerators, Aeration, Carbon dioxide removal, Feedwater treatment, Removal from feedwater, Carbonate.

Loading and flooding in packed irrigated towers and the relation of these phenomena to pressure drop are discussed. Empirical equations which permit pressure-drop estimations in the preloading range are given, and extensions of these equations to liquids other than water are made. In order to estimate the pressure drop in the loading-flooding zone, for which the equations will give low results, a generalized isobaric plot was prepared. The graphical presentation includes most of the loading data in the literature, and the chart indicates not only the state of loading of an irrigated tower but also the expected pressure drop. The correlation of the data pertaining to water, sucrose solution, and oils led to a slight modification of the generally accepted flooding correlation. Analysis reveals that incorporation in the ordinate of the density ratio of water to that of the irrigating liquid considerably improves the presentation of the data.

OPERATING EXPERIENCE AT THE MULTI-STAGE FLASH DEMONSTRATION PLANT, POINT LOMA, CALIFORNIA,
Westinghouse Electric Corp., Philadelphia, Pa.
R. E. Gaunt.
Water Production Using Nuclear Energy (Ed. by R. G. Post and R. L. Seale), p. 135-44, 4 fig, Univ. Arizona Press, Tucson, 1966. Proc. Am. Nucl. Soc. Symp., Mar. 1966, Tucson, Ariz.
Identifiers: *Operating experience, *Point Loma plant, Feedwater treatment, Multistage flash distillation, Pilot plant operations, Scale prevention, 0-50 MGD plant.

The 1-MGD, 36-stage flash evaporator demonstration plant operated from Nov. 1961 until early 1964. At this time it was dismantled and reassembled at the Guantanamo Naval Base in Cuba. A brief description of the plant and its demonstration features is given. Operation of the plant was quite satisfactory with mechanical difficulties, confined mostly to pumps and peripheral equipment, causing some interruptions during the first year of operation. Initial operation was with polyphosphate feedwater treatment which permitted operation at 200 deg F. A change to an acid treatment system permitted operation at 250 deg F and it was possible to increase the production rate to 1.4 MGD. Experience at Point Loma and other installations allows some confident predictions to be made about the future costs of producing potable water by the multistage flash process. Product cost was about $1.25/1000 gal when operating at 200 deg F but this dropped to about $1.00/1000 gal when the production rate was increased to 1.4 MGD. Studies show that with present-day technology large amounts of water can be produced for 25 to 35 cents/1000 gal in large dual-purpose plants.

CORROSION IN CARBON STEEL HEAT TRANSFER SURFACES,
Midwest Research Inst., Kansas City, Mo.
E. P. Shea, and W. R. Hollingshad.
OSW R and D Progr. Rept. No. 166, Dec. 1965. 129 p, 243 fig, 38 tab.
Identifiers: *Carbon steels, *Pitting (Corrosion), *Tubing (Metal), *Wrightsville Beach plant, Aeration, Corrosion, Corrosion tests, Deaeration, Heat transfer, pH control, Physical chemistry of scale, Pilot plant operations, Scaling, Seawater chemical analysis, Temperature control.

Results are described from operation of two distillation pilot plants at Wrightsville Beach to investigate effects of dissolved oxygen, pH, heat transfer rates and tube surface condition on corrosion of carbon steel evaporator tubes in seawater at temperatures to 250 F. It was concluded that steel tubes are not suitable for evaporator effects above atmospheric boiling. However, decarbonation and deaeration are essential for inhibiting scale formation and minimizing corrosion. Seawater pH should be maintained above 8. Greater corrosion was experienced at pH 7 than at pH 8. Tube surface condition had no appreciable effect on corrosion. The rate of heat transfer did affect corrosion. Greater corrosion occurred at the higher heat transfer rates unless scale formation inhibited attack. Scale formation was a problem at the higher Delta temperatures. At Delta temperatures of 12-16 F, scale formation was accelerated. Complete tabular data are presented for aerated and deaerated seawater systems on corrosion rates, tube penetrations, scale weights and analyses, and composition of Wrightsville Beach seawater.

ANALYSIS AND OPTIMIZATION OF A MULTIEFFECT MULTISTAGE FLASH DISTILLATION SYSTEM - PART I. PROCESS ANALYSIS,
Kansas State Univ., Manhattan.
L. T. Fan, C. Y. Cheng, C. L. Hwang, L. E. Erickson, and K. D. Kiang.
Desalination Vol 4, p 336-60, 1967, 13 ref. Also part of special Report No. 74, Kansas Engineering Experiment Station, Manhattan, Kansas (1967).
Identifiers: *Mathematical models, *Multiple effect distillation, *Multistage flash distillation, Design, Distillation processes, Heat balance, Material balance.

A mathematical model of a multieffect multistage flash distillation system that can be used in process optimization studies is developed. The model enables the heat input to the brine heater, the recycle flow rate in each effect, the concentration and temperature of the flashing brine leaving each effect, and the number of stages in each effect to be treated as variables in an optimization study. The model is believed to be accurate enough to describe the process, yet simple enough to be used in the simulation, design, and optimization of the process.
W70-04681

ANALYSIS AND OPTIMIZATION OF A MULTIEFFECT MULTISTAGE FLASH DISTILLATION SYSTEM - PART II. OPTIMIZATION,
Kansas State Univ., Manhattan.
L. T. Fan, C. Y. Cheng, C. L. Hwang, L. E. Erickson, and K. D. Kiang.
Desalination Vol. 4, p 361-88, 1968. 13 fig, 14 ref. Also Part of Special Report No. 74 Kansas Engineering Experiment Station, Manhattan, Kansas, 1967.
Identifiers: *Mathematical models, *Multiple effect distillation, *Multistage flash distillation, Design, Distillation processes, Heat balance, Material balance.

A mathematical model of a multieffect, multistage flash distillation system that can be used in process optimization investigations has been developed in Part I of this work. In the present part, the model is used together with an economic model of the system to minimize the cost of water production. The heat input to the brine heater per unit of feed, the recycle flow rate in each effect, and the concentration and temperature of the flashing brine leaving each effect are chosen so that the water production cost is a minimum.

CONCEPTUAL DESIGN STUDIES OF A DUAL-PURPOSE AND A VAPOR-COMPRESSION WATER-ONLY 750-MGD PLANT,
Oak Ridge Gaseous Diffusion Plant, Tenn.; and Office of Saline Water, Washington, D.C.
S. J. Senatore, and E. N. Sieder.
Preprint SM-113/33 of Paper Presented at IAEA Symp. Nucl. Desalination, Madrid, Spain, Nov. 18-22, 1968. 12 p, 5 fig, 3 ref.
Identifiers: *Conceptual designs, *Dual-purpose plant, *Heavy-water/organic-cooled reactors, *Single-purpose plant, *Southwest United States, Fixed charge rate, Municipal financing, Performance ratio, Turbine-generators, Vapor compression evaporation, Vertical tube evaporators, Water costs estimate, 250 plus MGD plant, 3000 plus MW (T) reactors.

To determine their potential for meeting long-range water and power requirements of the southwestern U. S., conceptual designs and cost estimates were prepared for a water-only and a dual-purpose plant, both with fresh water capacities of 750 MGD. The single-purpose plant consists of a 3962 MWT heavy-water moderated organic-cooled reactor coupled to a vapor compressor, vertical tube evaporator plant and is designed for a performance ratio of 20.40 lb product/1000 btu and 250 deg F maximum brine temperature. The dual-purpose plant consists of a 10,027 MWT HWOCR designed for a performance ratio of 10.47 product/1000 btu and for a maximum brine temperature of 250 deg F. Auxiliary power requirements at the site are estimated to require 275 MWE, leaving 1870 MWE available for sale and offsite product water conveyance. Based on municipal-type financing, with an annual fixed charge rate of 6.597%, the average cost of product water from the single-purpose plant at the plant boundary is estimated at 22.24 cents/1000 gal and at 18.47 cents/1000 gal for the reference dual-purpose plant.

ENGINEERING AND ECONOMIC EVALUATION STUDY OF REVERSE OSMOSIS,
Kaiser Engineers, Oakland, Calif.
F. L. Harris, G. B. Humphreys, H. Isakari and G. Reynolds.
Office of Saline Water Research and Development Report 509, 1969. 505 p. OSW Contract 14-01-0001-1669.

Descriptors: *Desalination, *Reverse osmosis, *Membrane processes, Cost optimization, Plant design.
Identifiers: *Desalination apparatus, Membranes, Computer algorithm, Economics.

A parametric engineering and economic analysis of the reverse osmosis process was performed in which water costs were examined for demineralizing feedwaters with salinities of 2000, 3000 and 5000 ppm in plant sizes of 1, 10 and 50 mgd capacity, product water recoveries of 50, 60 and 80%, and operating pressures of 400, 600 and 800 psi. Capital and operating costs were prepared using state-of-the-art technology for tubular, plate-and-frame, spiral wound, and hollow fine fiber reverse osmosis plant design concepts. Mathematical

models were prepared to represent the hydrodynamic characteristics of each design concept. These models, in conjunction with computer codes were used to optimize plant design and operating parameters. Plant capital and operating costs were also prepared on the basis of anticipated improvements in reverse osmosis technology. (Mintz-Office of Saline Water)

VACUUM FREEZING VAPOR COMPRESSION PROCESS: EVALUATION ON BRACKISH WATER,
Colt Industries, Inc., Beloit, Wis.
M. M. Jhawar, and J. H. Fraser.
Office of Saline Water, Research and Development Progress Report No. 541, April 1970. 46 p. OSW Contract 14-01-0001-967.

Descriptors: *Desalination processes, *Freezing, Brackish water.
Identifiers: *Vacuum freezing, Mobile unit.

A mobile vacuum freezing vapor compression (VFVC) pilot plant was designed, built and operated at its design capacity on both sea and brackish water. Tests were conducted at Roswell, New Mexico on 15,000 ppm well water. This water was very high in calcium sulfate. No scaling or precipitation were observed. Based on this work it is concluded that the VFVC process can be used to desalt any brackish water without the necessity of pretreatment.

RELATIONSHIP BETWEEN STORAGE CAPACITY AND LOAD FACTOR OF A DESALINATION PLANT,
Department of Economic and Social Affairs (UN).
A. R. Golze.
Proc, Int Seminar Econ Appl Water Desalination, p 185-205, September-October 1967. 21 p, 9 fig, 2 tab.

Descriptors: *Storage capacity, *Desalination plants, Optimization, Load distribution, Water supply, Computers, Models, Costs, Economics, California, Programs.
Identifiers: Storage facilities.

Relationships involved in comprehensive studies to determine the economic selection between alternative water supplies were discussed. Several typical situations in which a desalter might be justifiably involved in water supply and the utilization of its output were analyzed. The case where the desalter was the sole source of supply was selected to illustrate the type of optimization that could be accomplished. The relationship between storage capacity and the desalting plant load factor was derived and programmed for computer solution. An optimization model was developed and used to determine the operation of the desalination plant. A discussion of different types of storage facilities and of representative average cost of such storage facilities in California was presented. (Thiuri-Cornell)

ENGINEERING ASPECTS OF A NUCLEAR DESALTING PLANT,
Burns and Roe, Inc., New York.
J. G. Perri.
J. Power Div., Am. Soc. Civil Engrs., Vol 93 (PO1), p 31-50, 1967.
Identifiers: *Modular construction, Dual-purpose plant, Flash chambers, Flash evaporation, Layout, Multistage flash distillation, Nuclear desalination.

The dual-purpose plant is a transformation of the simple nuclear power and desalting plants but contains new elements conceptually different from the analogous elements in those simple plants and has special characteristics which greatly affect the design. One of the most important characteristics is the multistage controlled evaporator, that is, the complex of stages vertically assembled containing thin film evaporators. The problem posed by the modular concept required considerable study and technical background, the resulting coordinate procedure for the general assembly of the modules will produce a vessel-structure concept. The structural system is a central feature of great interest. Basically, it can be classified as an orthotropic plate system, however, its dual function of being a pressurized vessel and a supporting structure makes it an unusual engineering project.

FLASH DESALINATION PLANT - THE RESULTS OF THE FIRST TEN YEARS OF DEVELOPMENT AND FIELD PROVING,
Buckley and Taylor Ltd., Oldham (England).
W. Smith.
Water Eng. Vol. 69 (837), p 458-62, 1965. 5 fig.
Identifiers: *Distillation processes, *Reviews, Corrosion control, Instrumentation, Product ratio, Pumps, Scale prevention, Water utilization.

A variety of field-proved designs are currently available, providing a wide range of sizes of distillation plants with outputs from 2000 GPO to nearly 2 MGD. Considerable variation in performance ratio is available within the range 1.5/1 to 8/1, allowing the user a measure of control over the cost of the converted water. Perhaps the most significant proved application available today is the dual-purpose plant, since there is generally a need for increased power wherever there is a need for more water. In ten years the total of land-based distillation capacity has increased from 8 MGD to 40 MGD. Currently, the largest single unit operating commercially is about 1.5 MGD. However, design thought should be given to 50 to 150 MGD plants. Work is now in progress to study such problems as scale suppression techniques, corrosion/erosion prevention, automatic controls, and pumping problems. In many cases we cannot afford to wait for the final lowest cost water. Users and manufacturers should acknowledge that assessing future massive demands for water and large-scale conversion will only come several years hence. The world is thirsty now and this thirst must be quenched with water conversion equipment of present-day field-proved design.

INVESTIGATION OF WATER STEAM DROP CONDENSATION CONDITIONS,
L. A. Minuhin, V. B. Chernozubov, E. P. Emelina, A. A. Bolotov, and Z. M. Romanova.
Desalination, Vol 2, p 337-44, 1967. 4 fig, 6 ref. Also preprints from 2d European Symp.-Fresh Water from the Sea, Vol 2, Athens, May, 1967.
Identifiers: *Chemical additives, *Condensation promoters, *Dropwise condensation, Film condensation, Heat transfer coefficient, Heat transfer improvements.

Silicoorganic hydrophobizing liquids, copper and chrome oleates, machine oil, and paraffin were tested as dropwise condensation promoters. In the runs, copper, brass, and copper-nickel tubes of 8-40 MM OD and 0.3-5 M lengths were used. The runs were made with condensing steam under atmospheric pressure, introducing the promoter on the heating surface by bubbling steam through a solution of the promoter. Conclusions reached were (1) in the condensation of commercially polluted steam, promoter life is sharply reduced in comparison with its life using pure steam, (2) the reason for this reduction is the deposition of impurities of insoluble particles from polluted commercial steam on the hydrophobic surface, (3) continuous stable dropwise condensation is obtained by the continuous dosage of promoter as well as by periodical dosage at intervals in which good dropwise condensation is still maintained, (4) in the creation of dropwise condensation, decrease of drop size of a promoter in the steam permits use of smaller promoter doses, and (5) there is a definite range of optimal promoter concentrations in the bubbler at which the highest intensity of heat exchange at minimum promoter doses is obtained.

TEST OF THE PILOT DESALTING PLANT WITH RECIRCULATING SEED,
V. B. Chernozubov, E. P. Novikov, V. V. Kartovski, S. I. Golub, and V. G. Shatsillo.
Preprint from 2d European Symp.-Fresh Water from the Sea, Vol 2, Athens, May, 1967. 6 p, 1 fig.
Identifiers: *Seeding processes, *Chemical additives, Distillation processes, Feedwater treatment, Flash evaporation, Heat transfer coefficient, Multistage flash distillation, Pilot plant operations, Scale prevention, Scaling.

With water from the Caspian Sea, which has approximately the same composition of scale-forming ingredients as the ocean, tests were conducted in a small pilot flash plant to determine optimum conditions for scale prevention by the seeding process, which is simpler and less expensive than the more commonly used acidification. The plant consisted of a seven-stage flash evaporator, a main heater and a clarifier. Common ground chalk was used as the seeding agent. In the first series of experiments the seawater was heated to 115 and 125 deg C, and scale formation was retarded but not eliminated. Scale deposited intensively in the main heater and more formed on the exit parts of the tubes than on the entrance parts. The heat transfer coefficient was reduced by 50 to 60%. A second series of tests conducted with seawater heated to 95 and 105 deg C proved 95 deg to be the most practicable, although some problems were encountered due to water foaming in the stages. At 105 deg the heat transfer coefficient remained constant for the whole test period, but a thin film of scale formed on heating tubes. Experiments will be continued in an effort to develop operating conditions and seed composition which will provide scale-free heat exchange surfaces at higher seawater temperatures.

CONTROL OF ALKALINE SCALE USING CARBON DIOXIDE SUPPRESSION,
Oak Ridge National Lab., Tenn.
C. C. Littlefield, D. M. Eisenbert, and S. A. Reed.
ORNL-TM-2415, March, 1969. 34 p, 11 fig, 11 ref.
Identifiers: *Feedwater treatment, *Removal from feedwater, Carbonate, *Scale prevention, Bench scale, Carbon dioxide addition process, Carbon dioxide removal, Distillation processes, Experimental data, Seeding processes.

An investigation into the use of carbon dioxide for preventing scale in distillation-type desalination plants is in progress. Small-scale experimental work has been carried out with seawater in a 6-in.-dia combined flash decarbonator and scale precipitator in Wrightsville Beach and with fresh and salt water in 2-in.-dia countercurrent gas-liquid stripping columns in Oak Ridge. The experimental work has shown (1) that scale can be prevented in brine heater tubes by injecting carbon dioxide into cold brine prior to heating, (2) that the carbon dioxide may be removed by countercurrent

stripping of the hot carbonated brine with either air or steam, and (3) that the alkaline scale which precipitates upon removal of the carbon dioxide can be preferentially collected on solid surfaces such as the stripping column packing or on a high-surface-area solid such as activated alumina. The alkalinity of the exit seawater from the decarbonator has been reduced from the inlet value of about 110 ppm to as low as 20 ppm equivalent calcium carbonate. Further testing is required to define the design parameters for large desalination plant scale suppression systems.

A NEW RIVAL FOR FLASH DISTILLATION,
J. P. Lynam.
Power, Vol 112, No 9, p 79, 1968.
Identifiers: *Vapor compression evaporation, *Water costs estimate, Distillation processes, Economic evaluations, Multistage flash distillation, Proposals, Roswell Plant.

The vapor compression method for water desalting has not had the study it deserves. An OSW study of a 1-MGD plant lists water costs as $1,20/1000 gal for flash distillation, $1.35 for falling-film evaporation, and $1.57 for vapor compression. The study considers electrical power for vapor compression at 1 cent/KWH. However, an on-site diesel generator can provide power for less than half this figure. Also waste heat from such a diesel engine could be used to produce 43% additional product water. This would bring the product cost by vapor compression down to $0.98/1000 gal. It is unfortunate that these simple modifications were not incorporated into the Roswell Vapor Compression Plant. A gas-turbine vapor compression unit might lead to further cost reductions. We should reconsider the supposedly uneconomic vapor compression process in a new light.

DESIGN AND ECONOMIC STUDY OF A GAS TURBINE POWERED VAPOR COMPRESSION PLANT FOR EVAPORATION OF SEAWATER,
Struthers Energy Systems, Inc., Warren, Pa.; and Pratt and Whitney Aircraft, East Hartford, Conn.
H. Wightman, E. G. Rorstrom, F. C. Standifor, C. A. Bassilakis, and R. W. Foster-Pegg.
OSW R and D Progress Report No. 377, July, 1968. 292 p, 46 fig, 12 ref.
Identifiers: *Extended heat transfer surfaces, *Gas turbines, *Vertical tube evaporators, *Waste heat boilers, Compressors, Conceptual designs, Design, Direct costs, Economic evaluations, Falling film evaporation, Heat recover, Single-purpose plant economics.

The study of two sizes of gas turbine drivers was conducted and a 12,500 SHP, dual shaft, gas turbine driver was chosen as the main power train. The plant is designed to produce 8.0 MGD. The cycle uses a VTE and a MSF unit in series. The gas turbine driven axial flow vapor compressor operates across 4 effects of the VTE. Gas turbine exhaust heat is recovered in a heat recovery boiler. Only on-site power is generated in the back pressure turbine rated for 1500 kw. The water cost developed for the plant is $.39/1000 gal. The total capital cost of the plant is approximately $7,500,000. Drawings showing VTE tube sheet configurations and general outlines are provided. A heat and material balance is provided. Vendors bids received for plant equipment are provided.

EXPERIENCES WITH LARGE SEAWATER FLASH EVAPORATORS,
Technische Hogeschool, Delft (Netherlands).
FCAA Van Berkel, J. W. Van Hasselt, and J. H. Van der Torren.
Proc. Intern. Symp. Water Desalination, 1st, 1965, Washington 3, 189-212 (1967), 9 fig, 7 tables, 8 ref, paper SWD/94.
Identifiers: *Design data, *Flash evaporation, *Operating experience, Flowsheets, Layout, System descriptions.

The sources of information are the once-through evaporator of the Compania Shell de Venezuela refinery at Cardon, Venezuela, two brine recirculation evaporators of the government waterworks off the Island of Curacao (Netherlands Antilles), and the brine recirculation-distillate reheat evaporator of the Shell Curacao N.V. Refinery at Emmastad, Curacao. Flow diagrams and design data of the three evaporators are given. The specific heat consumption immediately after cleaning the evaporators was 5 to 15% higher than the design value (which already included a margin for fouling). The experiments showed that temperature indicator pockets should be installed in every flash chamber and in every water box to indicate poorly working flash chambers or condensers and pressure indicators should be installed in each stage to locate noncondensible gases.
W70-04934

COMBINED RECOVERY OF POTABLE WATER AND SEA SALT BY EVAPORATION an economic solution,
T. Messing.
Proceedings, 1st Intern. Symp. Water Desalination, 1965, Washington paper SWD/96, p 573-94, 1967. 12 fig, 4 tables, 11 ref.
Identifiers: *Economic evaluations, *Evaporators, Capitalized costs, Flash evaporation, Operating costs, Scale prevention, Scaling, Water costs estimate.

The operating conditions and a flow diagram of a messo desalting plant incorporating a 3-stage forced circulation evaporator installed in Kuwait (as a subsequent stage to a flash evaporation plant) are given. Scaling by calcium sulfate can be avoided either by chemical treatment of the preconcentrated seawater or by controlled precipitation of the calcium sulfate, using seeding techniques, during further concentration. The results of solubility isotherm investigations of salt in seawater of the Mediterranean at 40, 60, 80 and 100 deg C are given. The most efficient plants were found to be forced circulation evaporators of 10 to 20 stages and flash evaporators of 30 to 40 stages. After two years of operating the Messo plant (potable water output of 272 tons per day), it was found to operate according to design specifications. Total capital costs for an 8-stage flash crystallization plant for the recovery of salt are $7,254,000, including working capital costs of $350,000 for 60 days production. Potable water can be produced at a price ranging between DM 0.40 and DM 0.80 per cubic meter if the production costs come to DM 30 per ton sodium chloride and if a sales price of DM 70 per ton sodium chloride is calculated.
W70-04935

THERMOECONOMIC DESIGN UNDER CONDITIONS OF VARIABLE PRICE STRUCTURE,
Dartmouth Coll., Hanover, N.H.
M. Tribus, and R. B. Evans.
Proceedings, 1st Intern. Symp. Water Desalination, 1965, Washington, p 699-720, 1967. 6 fig., 4 tables, 18 ref.
Identifiers: *Distillation processes, Dual-purpose plant, *Economic evaluations, Energy costs, Thermodynamics, *Water costs estimate.

The costs of condensation-evaporation in a thermal or mechanical distillation system for seawater are 19.5 and 23.8 cents/1000 gal, respectively. The cost of electrodialysis for brackish water is 9.9 cents/1000 gal and for seawater is 80 cents/1000 gal. The cost of reverse osmosis is 32.2 cents/1000 gal. Figures indicate that the cost of steam (in a dual-purpose plant) drawn directly from a boiler (or superheater) is relatively independent of temperature over the range of steam temperatures normally occurring in power plants. The price structures for a linear plant with a fixed external price structure, for a liner plant with variable unit area cost, and for a plant with nonlinearity and variable price structure are given.
W70-04936

OPERATION OF THE 16-STAGE HIGH-TEMPERATURE FLASH PILOT PLANT,
Baldwin-Lima-Hamilton Corp., Eddystone, Pa.
R. A. Tidball, A. N. Rogers, G. Levite, and R. E. Woodbury.
OSW R and D Progress Report, No. 288, Oct., 1967. 106 p, 26 fig, 9 ref.
Identifiers: *Pilot plant operations, *Scale prevention, Blowby, Chemical additives, Flash evaporation, Heat transfer coefficient, Protective coatings, Scale removal, Scaling, Seeding processes, Tubing (Metal), Turbulence promoters.

Operation as a module of a typical commercial plant has confirmed the existence of a kinetic effect in the formation of calcium sulfate scale. The severe conditions imposed by this method of operation cause rapid changes in the heat transfer coefficient, permitting incipient scaling to be detected in a short run. A criterion is given to evaluate scale formation by means of changes in heat transfer coefficients, and a computer method was developed to calculate and plot these changes. Several commercial scale-prevention additives were tested. Some appeared to actually accelerate the deterioration of the heat transfer coefficient. Two of the additives may be of value and further tests should be made. Turbulence creators increased the heat transfer rate as predicted but they did not prevent scale. Tests are planned on a seeding process for scale prevention. Preliminary tests were made on protective coatings for steel. The more promising materials will be evaluated further.

RECYCLE BOOSTS DESALTING EFFICIENCY,
G. E. Weismantel.
Chem. Eng., Vol. 75, No. 15, p 86-88, 1968. 1 fig.
Identifiers: *Clair Engle Plant, Brine flow, Brine system designs, Flowsheets, Multiple effect distillation, Multistage flash distillation, System descriptions, Water costs estimate.

The process flowsheet and a brief process description are given for the Clair Engle Plant (dedicated in 1967). The plant was designed and built by Aqua-Chem for the OSW. It is a multistage multieffect facility with 3 effects and 68 stages. The first 2 effects have 23 stages each and the last has 22. Brine recirculation and long-tube design are major reasons for the high efficiency of the plant. The flow sheet indicates a product rate of 1 MGD operating at a maximum temperature of 250 deg F or 1.25 MGD at 290 deg F. OSW has not released a product cost figure, but it should be around 60 cents/1000 gal. New feedwater treatment facilities could reduce this by as much as 25%.
W70-04938

CONCEPTUAL DESIGN STUDY OF A 1-BGD MULTISTAGE FLASH DISTILLATION PLANT WITH TWO-LEVEL BRINE FLOW,
Oak Ridge National Lab., Tenn.
S. J. Senatore, and J. A. Smith.
ORNL-4201, Oct., 1968. 90 p, 21 fig, 4 ref.
Identifiers: *Multistage flash distillation, Conceptual designs, Concrete construction, Construction costs, Cost breakdowns, Deaerators, Flash chambers, Horizontal tube condensers, Instrumentation, Multilevel plants, Structural designs, Water costs estimate, 250 plus MGD plant.

The report presents the findings and conclusions of a conceptual design study of a 1-BGD MSF desalination plant for a hypothetical gulf of California location in 1975-1980. The desalting plant is coupled to two 5000-MWT boiling-water reactors through a backpressure turbine. The design uses a two-level brine recycle system with fifty flash evaporator stages, a flashing brine temperature

range of 250 degree F to 102.5 degree F, and a product water discharge temperature of 90 degree F. The evaporator shell is constructed of steel in the stages where the temperature is above 200 deg F and of steel-lined concrete below 200 deg F. The evaporator tubing is 90/10 copper-nickel with 0.035-in.-thick wall in the heat recovery section and 0.049-in.-thick wall in the heat reject section. The long-tube concept is used with two tube bundles of approximately 240 ft each in the heat recovery section. A two-stage spray deaerator and conventional sulfuric acid treatment is used for the makeup seawater. The total plant capital cost is $462,799,300 or $0.463 per daily gallon of capacity. Product water cost is estimated to be $0.169/1000 gallons.

ANALYSIS, DATA CORRELATION, AND OPTIMIZATION OF THE VAPOR REHEAT LIQUID-LIQUID HEAT EXCHANGE PROCESS,
Research Triangel Inst., Durham, N.C.
J. C. Orcutt, F. G. Mixon, and D. R. Whitaker.
OSW R and D Progress Report No. 198, Nov 1966. 61 p, 11 fig, 36 ref.
Identifiers: *Direct contact heat exchange, *Heat transfer, Brine heaters, Component designs, Computerized designs, Experimental data, Feedwater heating, Fluid flow, Heat exchangers, Thermodynamics, Vapor reheat processes.

An experiment to determine the effect of oil and water mixing on heat transfer efficiency is described. It is shown that the resistance to heat flow to individual oil droplets contributes a negligible component to the overall resistance in comparison to the large decrease in the effective thermal driving force caused by fluid mixing. A quantitative relationship between the apparent and effective number of heat transfer units is presented to illustrate the effect of mixing as represented by the peclet number for the tower. A formula to calculate the peclet number is derived from the experimental data and is recommended for use in designing spray towers of large diameters. The procedure for using mixing parameters in spray tower heat exchangers is described. The vapor reheat distillation process with liquid-liquid heat exchange has been simulated mathematically and incorporated into a computer procedure which determines the best design-operation policy for a given process configuration. This procedure should be of value in planning development work, as effects of new technology can be readily studied. The 1956 OSW cost procedure is used.

CONCEPTUAL DESIGN STUDY OF A 250 MILLION GALLONS PER DAY COMBINED VERTICAL TUBE-FLASH EVAPORATOR DESALINATION PLANT,
Oak Ridge National Lab., Tenn.
E. C. Hise, and S. A. Thompson.
OSW R and D Progress Report, No. 391, Aug., 1968. 200 p, 54 fig, 39 ref.
Identifiers: *Conceptual designs, *Multistage flash distillation, *Vertical tube evaporators, Capitalized costs, Component designs, Design, Design criteria, Flowsheets, Layout, Specifications, System descriptions, Water costs estimate, 51-250 MGD plant.

The conceptual design of a 250-MGD desalting plant combining a multistage flash feed heater with vertical evaporator effects in which tubes with fluted surfaces are used to obtain heat transfer performances significantly higher than those usually obtained with smooth tubes. The plant is contained in two trapezoidal reinforced-concrete structures, each housing two independent trains. The 15 vertical-tube effects are located above the 50 MSF stages. The vertical tubes condense 83% of the product water for the total plant output- the horizontal feed-heater-condenser tubes condense the other 17%. The overall plant performance ratio is 13. The estimated capital cost for the plant is 30 cents per daily gallon, and the estimated product cost is 12.9 cents/1000 gal. These costs are on a 1965 basis and apply to a follow-on plant - that is, it is assumed that a prototype plant had been built earlier. A cost review of the design by the Bechtel Corp., for a prototype plant and in 1967 dollars, indicated a capital cost of 38.3 cents per daily gal.

THE OPTIMAL DESIGN OF MULTI-STAGE FLASH EVAPORATORS BY DYNAMIC PROGRAMMING,
Syracuse Univ., N.Y.
S. Itahara, and L. I. Stiel.
Desalination, Vol. 4, p248-57, 1968. 3 fig, 3 ref.
Identifiers: *Computerized designs, *Mathematical models, *Programs (Computers), *Systems engineering, Distillation processes, Economic evaluations, Evaporator-condenser system designs, Evaporators, Flash evaporation, Heat balance, Material balance, Multistage flash distillation.

A method employing dynamic programming is described which adjusts the brine temperature decrement of each stage in a multistage flash evaporator to achieve minimum annual operating costs. The discussion employs an elementary evaporator model for which analytical solutions are available. A flow chart of a possible computer code is given. The evaporator area cost for an infinite number of stages if formulated. Finally, a method for handling the heat reject section is shown in mathematical notation.

CHAMBER GEOMETRY IN MULTI-STAGE FLASH EVAPORATOR - SEPARATOR STUDIES.
Weir Westgarth Ltd., London (England).

OSW R and D Progress Report No. 271, 1967. 97 p, 23 fig, 6 tab, 14 ref.
Identifiers: *Component testing, *Design data, *Entrainment, *Flash chambers, *Flash evaporation, Experimental data, Flow control, Liquid level control, Multistage flash distillation, Open channel flow, Research results.

An earlier study of the flash chamber geometry in multistage evaporators has shown that the length of flash chambers required for a range of flashing conditions could be specified (OSW R and D 108). This report describes additional work which has been carried out to study the separator characteristics and separation geometry in a flash chamber. The first part of this report covers a study of the foam heights and entrainment heights for a range of the flashing conditions normally met with in evaporators. The second part covers a study of the pressure loss and de-entrainment characteristics of the separator mesh. This information should allow the separator height to be specified for a range of flashing conditions and indicate the maximum value of vapor loading to which the separator can be taken while still giving a reasonable vapor purity above the separator. Further information is given on the effects of brine circulation, interstate temperature difference, splash plant configuration, and brine level variations. The increase in vapor loadings which can be obtained by dosing with an antifoam solution is indicated.

COMPARISON OF ECONOMIC DATA OF THE MAIN TYPES OF THE DESALTING DISTILLATION PLANTS,
S. I. Golub, I. L. Sergeenko, E. A. Sobolev, V. B. Chernozubov, and V. G. Shatsillo.
Desalination Vol 5, p 29-33, 1968. 5 fig. Preprint from 2d European Symp.-Fresh Water From The Sea, Vol 4, Athens, May, 1967.
Identifiers: *Multiple effect distillation, *Multistage flash distillation, *Parametric studies, Acid stabilization processes, Construction costs, Economic evaluations, Evaporators, Feedwater treatment, Flash chambers, Flash evaporation, Flowsheets, Scale prevention, Seeding process.

A comparison of multieffect flash and multistage evaporation plants to determine which is the more economically advantageous indicated that the price of product water is approximately the same for each under the same operating conditions and with fixed heat costs. Two main flowsheets were used as the basis for comparison (1) flash evaporation with seawater recycle and scale prevention by seeding or acid treatment and (2) direct-flow evaporation with seeding. Product water price for both types of plants proved to be 7 to 12% lower with evaporation chambers of concrete than with metal, and scale prevention by seeding proved less expensive than that by acid treatment of feedwater. Flash evaporation plants are preferable economically in case of high heat costs, whereas the multistage evaporation plant is economically advantageous when heat costs are relatively low.

THE EILAT 1,000,000 GPD, MSF, DISTILLATION PLANT OPERATING EXPERIENCE,
N. Zuckerman.
Preprint from 2d European Symp.-Fresh Water From The Sea, Vol 2, Athens, May, 1967. 28 p, 9 fig, 8 ref.
Identifiers: *Flash evaporation, *Multistage flash distillation, *Operating experience, Corrosion, Corrosion control, Corrosion problems, Distillation processes, Fouling, Israel, pH control, Scale prevention, 0-5C MGD Plant.

A brief history of the Eilat Plant, which began operation in 1965 and is presently delivering about 1 MGD of fresh water continuously at 1-3 PPM TOS. The evaporator is MSF recirculating cross-tube type designed for 200 deg F top brine temperature, performance ratio 8 to 1, concentration factor 1.7, with scale prevention originally by Hagevap LP treatment but later converted to PH control. The influence of controlled parameters

and of additives on fouling, foaming, corrosion, performance ratio and distillate output is described, analyzed and discussed. Actual performance is compared to results of a mathematical model programmed for a digital computer. High temperature tests are described, and the importance of matching conditions to chamber geometry is discussed.

DESIGN, OPERATION, AND RESULTS OF THE LARGEST FLASH-TYPE SEAWATER CONVERSION PLANT AND ITS EFFECT ON FUTURE CONVERSION PLANTS.
Westinghouse Electric Corp., Philadelphia, Pa.

Proc. Am. Power Conf, Vol 24, p 751-59, 1962. 6 fig.
Identifiers: *Dual-purpose plant, *Flash evaporation, *Reviews, Point Loma Plant, Water costs estimate, Water utilization.

Current U.S. water usage is running at the rate of about 323 BGD. By 1975 it will be 453 BGD, and by 1980 it will be 597 BGD, which is 82 BGD more than the estimated supply. Desalination of sea and brackish water can meet this shortage. To date about 50 land-based flash evaporators have been purchased throughout the world, including a 1 MGD unit at Point Loma, Calif. Design work and data taken since the inception of this plant show that flash distillation on a larger scale can produce water at a cost low enough to compete with conventional supplies in many areas. Further economies can be obtained with dual-purpose plants so that water can be produced for 41 cents/1000 gal. The design and construction of dual-purpose plants will meet the water needs, base-load power systems, develop the service areas, and may result in new low costs for power generating facilities.

STUDY OF 250-MGD MULTISTAGE FLASH DISTILLATION PLANT WITH TWO-LEVEL BRINE FLOW - PART 1, DESIGN AND COST ESTIMATE - PART II, PRELIMINARY ENGINEERING ANALYSIS AND CAPITAL COST ESTIMATE,
Oak Ridge National Lab., Tenn.; and Bechtel Corp., San Francisco, Calif.
S. J. Senatore, and J. A. Smith.
ORNL-4214, Nov., 1968. 257 p, 56 fig, 3 ref.
Identifiers: *Conceptual designs, *Multilevel plants, *Multistage flash distillation, Concrete construction, Construction costs, Cost breakdowns, Deaerators, Flash chambers, Horizontal tube condensers, Instrumentation, Structural designs, 250 plus MGD plant.

The report presents the findings and conclusions of a conceptual design study of a 250-MGD MSF desalination plant for a hypothetical Southern California location in 1975-1980. The plant is coupled to a 2500-MWT boiling-water reactor through a backpressure turbine. The design uses a two-level brine recycle system with fifty stages, a flashing brine temperature range of 250 deg F to 91.8 deg F and a product water temperature of 90 deg F. The evaporator shell is steel above and steel-lined concrete below 200 deg F. The evaporator tubing is 90/10 copper-nickel with 0.035-in.-thick wall in the heat recovery section and 0.049-in.-thick wall in the heat reject section. The long-tube concept is used with two tube lengths of approximately 240 ft each in the heat recovery section. A two-stage spray deaerator and conventional sulfuric acid treatment is used for the makeup seawater. The total plant capital cost is $149,725,000 or $0.5999 per daily gallon of capacity. The water cost is $0.205/1000 gal.

OPERATING EXPERIENCES AT THE LTV DEMONSTRATION PLANT, FREEPORT, TEXAS,
Stearns-Roger Corp., Denver, Colo.
R. W. Akerlow.
Water Production Using Nuclear Energy, Proc. Am. Nucl. Soc. Symp., Mar., 1966, Tucson (ed. by R. G. Post, R. L. Sealf), p. 112-33, 3 fig, 10 ref, Univ. Arizona, Press, Tucson, Ariz, 1966.
Identifiers: *Freeport plant, *Operating experience, *Vertical tube evaporators, Acid stabilization processes, Component development, Deaerators, Feedwater treatment, pH adjustment, Scale prevention, Scale removal.

This plant has been in operation since 1961. Studies have led to the elimination of scaling, better utilization of heat transfer surfaces, and improvement in the distributed flow conditions in the tubes. Magnesium hydroxide seeding proved impractical to prevent scaling, but the pH method of scale control was shown to be effective. Carbon steel tubing was not practical, particularly since acid addition was needed for scale control. The steel tube was replaced with aluminum-brass. It was found that, without forming anhydrite scale, the upper limit of seawater flashing range is 27 deg F on the steam side. Polyphosphate addition was very effective as a means of scale removal. Magnesium anodes were unsuccessful in the protection of steel heat exchangers. However, an impressed current protection system appeared promising. Waste heat sources at temperature levels as low as 140 deg F can be considered practical for recovery in an LTV system. Under normal conditions, one MGD of water can be economically produced from seawater in an LTV system for each 7500 KW of generating capacity, utilizing only the waste heat from a gas turbine.
W70-04952

CONTINUOUS COUNTER-CURRENT ION EXCHANGE REMOVAL OF CALCIUM FROM SEA WATER TO PREVENT SCALING OF DISTILLATION EQUIPMENT.
Oak Ridge National Lab., Tenn.; and Chemical Separations Corp., Oak Ridge, Tenn.

OSW, R and D Progress Report No. 309, Nov., 1967. 69 p, 27 fig, 3 ref.
Identifiers: *Feedwater treatment, *Ion exchangers, *Scale prevention, Material balance, Precipitates, Removal from feedwater, Calcium, Carbonate, Scaling.

A 65% removal of calcium from seawater was demonstrated by chem-seps continuous countercurrent ion exchanger at Freeport, Texas, LTV Plant. Calcium hardness as calcium carbonate was reduced from 800 PPM to 280 PPM in the effluent from exchanger. Removal of 65% calcium prevents precipitation of anhydrites at 300 deg F. This results in heat savings of 20% and a permissible concentration factor of five rather than three. Flowsheets and theoretical material balances are included.
W70-04953

TESTS OF DEAERATOR AT THE FREEPORT SEAWATER DESALTING PLANT AND EVALUATION OF DISSOLVED GAS ANALYSIS.
Oak Ridge National Lab., Tenn.

OSW R and D Progress Report No. 310, Nov., 1967. 44 p, 11 fig, 9 ref. Also ORNL-TM-1953.
Identifiers: *Carbon dioxide analysis, *Deaerators, *Oxygen analysis, Columns (Process), Component development, Component specifications, Freeport Plant.

Tests made on the Freeport deaerator showed that oxygen could be reduced to 10 PPB and carbon dioxide to 3 PPM. Test runs were made with liquid rates of 10,600 and 17,000 LB/HR sq ft. Cambridge instrument gas analyzer was used for detection of oxygen and carbon dioxide. Further work is required to check the validity of the calibrator before reading can be considered reliable.
W70-04954

OPTIMUM BRINE HEATER OUTLET TEMPERATURE IN SEA WATER CONVERSION EVAPORATORS.
Bechtel Corp., San Francisco, Calif.

OSW R and D Progress Report No. 175, Apr., 1966. 160 p, 34 fig, 17 ref.
Identifiers: *Brine heaters, *Feedwater heating, Brine system designs, Computerized designs, Cost breakdowns, Economic evaluations, Energy costs, Evaporator system design, Flash evaporation, Ground rules, Multistage flash distillation, Parametric studies, Plant layout, Water costs estimate.

Large size nuclear power and water desalting plants may answer the future needs of an expanding civilization for power and water, but the more immediate problem of providing incremental water supplies up to 50 MGD where no power is needed is unanswered. A single-purpose fossil-fueled desalination plant with a capacity from 8 to 50 MGD has been developed. A modification of this plant with acid pretreatment and operating at 290 deg F maximum brine temperature will produce 50 MGD of water at 30 cents/1000 gal with fuel at 20 cents/MBTU, or produce water at 36 cents/1000 gal with 30 cents/MBTU fuel. If scale control methods costing no more than acid pretreatment can be developed, permitting the plant to operate at its optimum temperature of 350 deg F, then water costs drop to 28.2 cents/1000 gal and 33 cents/1000 gal, respectively. Total water costs have been developed for brine heater outlet temperatures from 250 deg F to 400 deg F, for fuel costs of 20, 30 and 40 cents/MBTU. From these, costs affordable for scale prevention at the different temperatures and fuel costs have been determined. Two ORNL and one Bechtel evaporator design computer codes were modified and used for the study.
W70-04955

A STUDY OF THE MECHANISM OF FLASHING FLOW BY EXPERIMENT AND THEORETICAL ANALYSIS,
Atomic Energy Establishment, Winfrith (England).
R. I. Hawes, and D. C. Leslie.
Desalination Vol 2, p 329-36, 1967. 7 fig, 5 ref. Also preprint from 2nd European Symp.-Fresh Water From The Sea, Vol 2, Athens, May, 1967.
Identifiers: *Bubble dynamics, *Flash chambers, *Flow distribution, Flash evaporation, Fluid dynamics, Orifices, Pressure drop, Research results, Steam flow, Turbulence, Turbulent flow.

A new theory of flashing flow is described which assumes that all bubble nuclei are present when the pressure is reduced. Steam formation occurs by conduction of heat to the surfaces of these nuclei, followed by evaporation at the surface. As the bubbles grow, the two-phase mixture is accelerated in the duct, producing a pressure drop and a further increase in the superheat. An experimental study suggests that when the superheat is small, nucleation of bubbles does not occur within the bulk of the fluid and that steam formation only occurs at existing interfaces. In a desalination plant, growth of bubbles swept from one stage to the next or flashing at the free surface is likely to be most important. Measurements of the growth of steam bubbles in superheated seawater show good agreement with the theoretical predictions during the initial stages but the theory underestimates the growth rate further away from the change in pressure.

THE OPTIMAL DESIGN OF DESALINATION SYSTEMS.
Kansas State Univ., Manhattan.

Desalination Vol 3, p 225-36, 1967. 14 fig, 17 ref. Also preprint from 2d European Symp.-Fresh Water From The Sea, Vol 4, Athens, May, 1967.

Identifiers: *Economic evaluations, *Design, Membrane processes, *Multiple effect distillation, Multistage flash distillation, Osmosis, Water costs estimate.

Process analysis and optimization studies have been made for a multi-effect multistage flash distillation system and a multistage reverse osmosis system. In the distillation system, the heat supplied to the brine heater, the brine reject concentration, the recirculation rates within each effect, and the allocation of brine temperature and composition among the effects are controlled to arrive at an optimal policy. In the reverse osmosis process, multistage operation is compared with single-stage operation. The recirculation rates in each stage, the allocation of brine composition among the stages and the operating pressures in each stage are controlled to arrive at the optimal operating condition. A flow-work exchanger is incorporated into the reverse osmosis system and its quantitative advantages are examined under optimal conditions. A discrete form of the maximum principle in combination with other optimization techniques has been used for most of the optimization studies.

THE FLOW OF FLASHING WATER IN CONDUITS.
Heriot-Watt Univ., Edinburgh (Scotland); and Glasgow Univ., (Scottland).

Desalination Vol 2, p 175-95, 1967. 15 fig, 7 ref. Also preprint from 2d European Symp.-Fresh Water From The Sea, Vol. 4, Athens, May, 1967.
Identifiers: *Entrainment, *Flash evaporation, *Steam flow, *Vapor release rate, Distillation processes, Evaporators, Flow distribution, Horizontal tube evaporators, Multistage flash distillation, Turbulence promoters, Vapor compression evaporation, Vertical tube evaporators.

An analysis of flashing flow is presented in which the local rate of vapor formation is introduced, since its finite value determines the nonequilibrium character or flashing flow. A simple theoretical model is developed for calculation of the rate of vapor formation equations are set forth to describe flashing flow, and analytical solutions are presented for the simple frictionless flow case. For the more general problem including friction effects, numerical solutions are given. Experimental work on flashing flow in both horizontal and vertical tubes of 1-in. diameter show good agreement over a range of friction factors of 0.113 to 0.805 reciprocal feet. Turbulence promoters were introduced into the test sections to increase the equilibration, and their effects are reported. Experiments using two-component air-water mixtures made to check the slip between the phases and to determine the two-phase friction factors are reported.

PROBLEMS LIKELY TO BE ENCOUNTERED IN THE DESIGN OF LARGE FLASH DISTILLATION PLANT,
Applied Research and Engineering Ltd., Durham (England); and International Combustion Export Ltd., London (England).
R. Starmer, F. C. Thornley, and J. A. Modet.
Desalination Vol. 3, p 343-52, 1967. 8 fig, 5 ref. Also preprint from 2d European Symp.-Fresh Water From The Sea, Vol 2, Athens, May, 1967.

Descriptors: *Flash Evaporation, *Tube bundle design, *Tubing (Metal), Distillation processes, Economic evaluations, Flow measurement, Heat transfer coefficient, Heat transfer improvements, Heat transfer surfaces, 51-250 MGD Plant.

The economics and technical problems of desalination plants as large as 100 MGD are evaluated with respect to tube positions, possibilities of reducing vessel width, method of fitting total tube area, and importance of water flow problems. It is shown that for evaporator modules of over 5 MGD, tubes lying in the longitudinal axis are more compatible with requirements of tube length/stage and of shallow tube bundles. Potential cost advantages of reducing vessel width are counterbalanced by increases in brine flow rates, vessel length, tube diameter, orifice, and stage height as well as difficulties in obtaining full flashoff. It is considered that brine flow rates should not exceed 1 million LBS/HR ft width. A study of fitting the total tube area indicates that tubes of 3/4 to 1-inch diameter and of the longest possible lengths are best, but practical aspects of transport and handling must be considered. Economic advantages to be achieved in increasing module size are relatively small because tubing cost is already of such magnitude that further size increase gives little advantage. Any appreciable advantage must result from cost reductions in the evaporator shell, pumps, other auxiliaries, instrumentation, foundation, land costs and erection work.

EFFECTS OF FOREST COVER MANIPULATION ON WATER YIELD AS STUDIED BY AN ELECTRIC ANALOG,
Washington Univ., Seattle. Coll. of Forest Resources.
David D. Wooldridge.
Available from the Clearinghouse as PB-190 324, $3.00 in paper copy, $0.65 in microfiche. Completion Report, University of Washington, Seattle, January 1970. 16 p., 6 fig, 5 ref. OWRR Project A-027-WASH.

Descriptors: *Analog models, *Forest management, *Infiltration, Water yield, Watershed management, *Precipitation intensity, Hydrologic models, Rainfall-runoff relationship, Computer models.

Review of a wide variety of hydrologic modeling procedures resulting in a conclusion that the methods of Riley, et al. (1966) were most suitable for general forest hydrology needs. A function generator is used to generate any type of a precipitation event. This precipitation event becomes an input into a series of storage and flow equations. Infiltration as a flow process described by the equation of Horton (1940) is analyzed in detail for influences of various input parameters. Solution of this type of problem is a good example of the utility of electric analogy in the solution of hydrologic problems. Continuous solutions over time may be visually displayed and the influence of changing coefficients studied quantitatively after correct initial scaling. Related aspects of this research are continuing.

THE RANGELANDS OF THE WESTERN U.S.,
California Univ., Davis. Dept. of Agronomy.
R. Merton Love.
Scientific American, Vol 222, No 2, p 88-96, February 1970.

Descriptors: *Range management, *Brush control, *Water yield improvement, *Pasture management, Cattle, Ranges, Grasslands, Grazing, Southwest U.S., Recreation demand, Revegetation, Multiple purpose, Rocky Mountain region, Desert plants.
Identifiers: *Western U.S., *Vegetation manipulation.

Cattle grazing is the primary use of the rangeland in the western United States. The western ranges fall into three distinct categories: Northern Rocky Mountain, Intermountain, and Southwest. True grassland is rare in the Southwest. Instead, desert and semi-deserts predominate. Vegetation management is the major problem in improving the ranges lands. Brush conversion programs have shown substantial increases in water yield in the treated areas. This is due to the fact that an acre of brush uses six more acre-inches of water than does herbaceous vegetation. (Carr-Arizona)

THE WATER SITUATION,
Arizona State Water Engineer; and Arizona Interstate Stream Commission.
Wesley E. Steiner.
In Arizona Watershed Symposium, 13th, Phoenix, Arizona, September 24, 1969, Proceedings, p 11-14.

Descriptors: *Arizona, *Planning, *Water supply, *Water resources, *Water allocation (Policy), Arid lands, Groundwater, Overdraft, Urbanization, Population, Growth rates, Land use, Irrigation, Water resources development, Subsidence, Decision making, Optimum development plans, Water demand, Water yield improvement.
Identifiers: *C.A.P. (Central Arizona Project), *Arizona Interstate Stream Commission.

Arizona, an arid state, is experiencing an enormous rate of growth. Without an adequate water supply this growth will be severely limited. Even though urban land uses are expected to take over much of the presently irrigated agricultural acreage, current federal and state studies project an increase in total irrigated acreage in the future. The central Arizona area already has a groundwater overdraft of 2.2 MAF per year. Operation of the Central Arizona Project will still leave central Arizona with a 1 MAF annual overdraft. Although CAP will not totally relieve Arizona's water problems, it will buy time for the state until other plans can be developed. Planning for future projects should begin immediately. (Carr-Arizona)

FOG IN ISRAEL,
Israel Meteorological Service, Bet Dagan. Div. of Synoptic Meteorology.
M. Levi.
Israel Journal of Earth-Sciences, Vol 16, No 1, p 7-21, 1967. 10 fig, 2 tab, 6 ref.

Descriptors: *Fog, *Moisture, *Semi-arid climates, *Winds, Anticyclones, Transportation, Agriculture, Meteorology, Fronts (Atmospheric), Air circulation, Water vapor, Atmospheric pressure, Synoptic analysis, Radiation.
Identifiers: *Radiation fog, *Israel, Inversions, Sudan Trough, Khamsin depression.

Generally only radiational fog occurs in Israel. True advection fog is very rare. Typical fog-inducing meteorological situations include a warm upper anticyclone, a shallow surface pressure ridge in the wake of a cold front, influence of the Sudan Trough, an approaching Khamsin depression, and the passing of a weak, dissolving cold front. Fog occurs infrequently on the Israeli coastal plain, but is more common in the northern valleys of Israel and in parts of the Northern Negev. Fog is not a major problem in Israel, but it does occasionally tie up the transportation process. Fog is also important in the semi-arid Israeli climate as a source of additional moisture supply for agriculture. (Carr-Arizona)

ESTHETIC INTERESTS IN WATER YIELD IMPROVEMENT,
Arizona Conservation Council.
Paul W. Van Cleve.
In Arizona Watershed Symposium, 13th, Phoenix, Arizona, September 24, 1969, Proceedings, p 25-28.

Descriptors: *Arizona, *Natural resources, *Water resources development, *Conservation, *Water yield improvement, Recreation demand, Scenery, Wildlife, Habitats, Phreatophytes, Chaparral, Brush control, Flood control, Aesthetics, Water management (Applied).
Identifiers: *Salt River Project, *Bureau of Reclamation, *U.S. Army Corps of Engineers, Wilderness.

One of Arizona's most valuable natural resources is its reputation for scenic beauty. This natural beauty is a very vulnerable resource that is presently under tremendous pressure by forces of growth. The Salt River Project opposes two proposed wilderness areas in Arizona in favor of a very high-cost, low-yield chaparral treatment program. The U.S. Army Corps of Engineers is singularly unimaginative in its Maricopa County food control project designs. The interagency phreatophyte control program also gives little consideration to recreation, scenic beauty, and wildlife habitat in streamside areas. Conservation organizations recognize the critical need for water yield improvement projects. Care must be taken in the development of such water yield and flood control programs not to sacrifice esthetic values unnecessarily. (Carr-Arizona)

3C. Use of Water of Impaired Quality

IRRIGATING VEGETABLES WITH BRACKISH WATER,
Agricultural Research Service, Athens, Ga. Soil and Water Conservation Research Div.; and Georgia Agricultural Experiment Station, Athens.
F. L. Long, J. M. Daniels, and J. R. Carreker.
American Society of Agricultural Engineers, Transactions, Vol 11, No 2, p 171-174, March-April 1968. 4 fig, 3 tab, 5 ref.

Descriptors: *Vegetable crops, *Irrigation water, *Brackish water, *Saline water, *Salt tolerance, Salinity, Irrigation practices, Irrigation, Georgia, Plant physiology, Leaching, Soil properties, Electrical conductance, Saturated soils, Rainfall, Crop production.
Identifiers: *Turnips, *Kale, *Collards, *Snapbeans.

Irrigation with saline water adds salts to the upper level of the soil. This may cause a salt problem in soils ordinarily considered nonsaline. In determining whether or not to use a particular brackish water supply for irrigation it must be remembered that some crops are more salt-sensitive than others. Also, plants in the seedling stage are generally more susceptible to salt damage than mature plants. A 3-year experiment studied the use of brackish vs. salt-free water in the irrigation of kale, collards, turnips, and snapbeans. The results showed that saline irrigation had no significant effect on the yield of kale, collards, and turnips, but lowered the yield of snapbeans considerably. The study also showed that rainfall was very effective in leaching the applied salts from the plots. These results have positive implications for irrigation of crops with saline water in the arid Southwest. (Carr-Arizona)

A STUDY OF THE EFFECT OF WATER QUALITY AND MANAGEMENT ON PHYSICAL AND CHEMICAL PROPERTIES OF SELECTED SOILS UNDER IRRIGATION,
North Dakota State Univ., Fargo. Dept. of Soils.
Fred W. Schroer.
Available from the Clearinghouse as PB-190 357, $3.00 in paper copy, $0.65 in microfiche. Technical Completion Report, North Dakota Water Resources Research Institute, February 1970. 48 p, 7 tab, 13 fig, 9 ref, append. OWRR Project A-005-NDAK.

Descriptors: *Irrigation water, Soils, *Saline soils, Saline water, *Soil physical properties, *Soil chemical properties, Carbonates, Sulfates, Loams.
Identifiers: Soil salinity.

The experiments were conducted by the North Dakota Agricultural Experiment Station in the greenhouse, and at four sites in irrigated fields. Eight by 21 inch columns of Heimdal (Typic Haploboroll) loam were seeded with alfalfa and irrigated for 20 months with 18 synthetic waters and distilled water. The waters represented groundwaters and streams of North Dakota. They ranged in salinity and sodium hazard from C2S1 to C4S4 (US Salinity Lab. Classification). Anions were HCO3 and SO4. One series had excess HCO3 over Ca plus Mg. Treatments were replicated five times. About 145 inches of water was applied in 79 irrigations to produce 24 cuttings of alfalfa. Carbonates precipitated in the lower half of columns with C2 waters. Both SO4 and CO3 salts precipitated in soils with C3 and C4 waters. ESP of soils increased with increasing SAR of the waters applied. Excess HCO3 increased soil ESP, caused ESP maxima near the soil surface, and greatly decreased infiltration rates compared to waters of similar salinity and SAR without excess HCO3 . Increasing SAR caused lower infiltration rates, but increasing salinity opposed this trend. Chemical analyses of four field irrigated soils were compared with similar data obtained prior to or near the initiation of irrigation. The Straw loam at Dickinson was near equilibrium with C2S1 water applied by gravity for 23 years, at 18 inches per year. Salinity and ESP were lower than before.

3D. Conservation in Domestic and Municipal Use

UTILITIES ON PERMANENT SNOWFIELDS,
Army Terrestrial Sciences Center, Hanover, N.H.
Malcolm Mellor.
Cold Regions Research and Engineering Laboratory, Science and Engineering Monograph III-A2d, October 1969. 37 p, 23 fig, 46 ref. DA Project 1T062112A130.

Descriptors: *Water supply, *Waste disposal, *Public utilities, *Cold weather construction, *Cold regions, Polar regions, Antarctic, Arctic, Sewage disposal, Melting.
Identifiers: *Snowfields, Cold region engineering.

Water supply, waste disposal, heating, ventilating and fire protection at installations built on polar ice sheets are described. The section on water supply discusses energy requirements, consumption rates, water quality and treatment, techniques and equipment for melting snow and ice, and water distribution systems. A number of actual water supply systems are described in detail. The section on waste disposal deals with sewage and sewage sinks, latrines, garbage, trash and scrap, and radioactive waste. Examples of sanitation systems at polar bases are described in some detail. The section on heating discusses heating load, heat losses and insulation, energy sources, and heating systems. The ventilation section covers air demands, intakes and exhausts, ventilation of undersnow tunnels, and carbon monoxide problems. Fire protection is discussed briefly. (Knapp-USGS)

IRRIGATION IN THE TEXAS HIGH PLAINS AND THE TEXAS WATER PLAN,
Texas Tech Univ., Lubbock.
Dan M. Wells.
Pap, Amer Soc Civ Eng Irrig Drain Div Conf, Austin, Tex, Nov, 1969. 16 p, 4 tab, 5 ref.

Descriptors: *Irrigation, *Value, *Economic impact, *Texas, Economics, Agriculture, *Economic justification, Crop production, Crops, Irrigated land, Economics, *Benefits, Agronomic crops, Farm prices, Water costs.
Identifiers: *Texas Water Plan, High Plains (USA), Ogallala formation, Agricultural economics.

Without the Texas Water Plan, or a similar plan for importing water to the High Plains of West Texas, irrigated agriculture there will start a decline that will end in oblivion in less than a century. The secondary and tertiary benefits to irrigation in the High Plains far outweigh the primary benfits. The value of irrigation in areal economy cannot be estimated on the basis of the value to farm operators alone; merchants, suppliers, processors of agricultural products, bankers, and the general population depend upon the output from irrigated agriculture to supply the capital and operating expenses for maintaining the economy. If imported water is not made available to replace the declining supplies available from the Ogallala, agriculture will not collapse, but agriculture-based businesses will feel the backlash of a decline in agricultural production. The nonagricultural segment of the High Plains should be willing to subsidize the importation of water required to sustain the present level of irrigated agriculture. Neither the State of Texas nor the Nation can afford to lose the production and consumption associated with the present and projected levels of High Plains irrigated agriculture. (USBR)

MECHANICAL STRUCTURES FOR FARM IRRIGATION,
Agricultural Research Service, Kimberly, Idaho. Snake River Conservation Research Center.
Alan S. Humpherys.
Proc Amer Soc Civ Eng, J Irrig Drain Div, Vol 95, No IR4, p 463-479, Dec 1969. 17 p, 17 fig, 2 tab, 3 ref, 3 append.

Descriptors: *Automation, *Irrigation systems, *Automatic control, *Control structures, *Hydraulic gates, Irrigation, Irrigation practices, Irrigation

engineering, Turnouts, Mechanization, Water control, Movable dams, Water distribution (Applied), Timing, Farm equipment, Control systems, Check structures, Check dams, Furrow irrigation.

Mechanical, automatic irrigation structures that can save water and labor are being developed for surface irrigation systems. The timer-controlled and automatic water-pressure-controlled structures are being tested in various types of irrigation systems. A specially designed mechanical timer is used to control semiautomatic irrigation checks and gates. Generalized design information is presented for a timer-controlled check dam for lined and unlined ditches. A pressure gate that opens and closes automatically when water in the channel approaches a certain depth is described. Other structures include a drop gate, metal apron gate, and water level control checks. Certain operational problems such as rodent and weed control require greater emphasis with automatic irrigation than with conventional systems. (USBR)

AUTOMATION OF SURFACE IRRIGATION SYSTEMS,
Agricultural Research Service, Fort Collins, Colo.
Howard R. Haise, and E. Gordon Kruse.
Proc Amer Soc Civ Eng, J Irrig Drain Div, Vol 95, No IR4, p. 503-516, Dec 1969. 14 p, 13 fig, 9 ref, append.

Descriptors: *Irrigation systems, Automatic control, Automation, Water control, Control structure, Hydraulic gates, Mechanization, Check dams, Hydraulic gates and values, Butterfly valves, Surface irrigation, Furrow irrigation, Turnouts, Control systems, Water distribution (Applied), Timing, Telemetry systems, Check structures.

Surface irrigation can be automated by using pneumatic valves controlled electronically by tone telemetry to open and close turnouts on a timed basis. However, features of cost, reliability, and safety make a hydraulically powered system appear more feasible. The hydraulic system, using cylinders to operate center pivot gates, can be adapted to a variety of open-ditch systems. Hydraulic systems can be used to open or close gates or to modulate gate openings to maintain a constant water level upstream or downstream from the gate. Two systems for automating surface irrigation are described. One system uses pneumatic valves remotely controlled by tone telemetry to open and close turnouts at timed intervals; the other uses waterpowered cylinders activated by float valves to operate center pivot gates. Large fluidic diverters have also been evaluated for irrigation applications. The automation components can be adapted to furrow, border dike, and basin-irrigated fields supplied by open ditches or buried pipelines. Several field systems have been evaluated. (USBR)

EFFECTS OF CONSERVATION TREATMENTS ON WATER YIELD,
Agricultural Research Service, Riesel, Texas. Southern Plains Branch; and Texas Agricultural Experiment Station, Riesel.
Ralph W. Baird, and Clarence W. Richardson.
In: Effects of Watershed Changes on Streamflow, Water Resources Symposium No 2, Austin, Texas, October 1968, p 69-78, University of Texas Press, Austin and London, 1969. 10 p, 4 fig, 3 tab, 2 ref.

Descriptors: *Agricultural watersheds, *Land management, *Watershed management, *Texas, Runoff, Sediment yield, Demonstration watersheds, Contour farming, Terracing, Vegetation establishment, Land forming, Erosion control.
Identifiers: Experimental watersheds.

The effects of land-use changes and conservation treatments on storm runoff from 4 small agricultural watersheds, ranging in size from 20 to 309 acres, are being studied at the Blacklands Experimental Watershed near Riesel, Texas. The soils of the watersheds are primarily Houston Black clay and closely related soils developed from marls of the Taylor formation. These soils are calcareous montmorillonite clays that shrink and swell with drying and wetting. Internal drainage is slow, and during prolonged periods of excess rainfall, free water may be held near the surface for appreciable periods of time. During extreme dry periods the soils shrink, and cracks several inches wide to depths of 3 feet or greater are common. Conservation practices that control the flow of water on cultivated fields and the use of agronomic practices that increase crop production with more residue to return to the soil may reduce storm runoff from small watersheds as much as 20 to 25% over a period of years. Because of the short period of record, the effects of changes from cultivated areas to permanent grasses used for grazing is not as well defined, but available data indicate that grazing of grasslands can be managed to increase storm runoff, with smaller amounts of sediment. (See W70-04723). (Knapp-USGS)

EFFECTS OF MODERATE SHEEP STOCKING ON PLANT POPULATIONS OF A BLACK OAK-BLUEBUSH ASSOCIATION,
Adelaide Univ. (Australia). Dept. of Botany.
Susan Barker, and R. T. Lange.
Australian Journal of Botany, Vol 17, No 3, p 527-537, December 1969. 13 fig, 4 tab, 10 ref.

Descriptors: *Stock water, *Vegetation, *Plant populations, *Stocking, Water holes, Arid lands, Ranges, Sheep, Grazing, Forage, Vegetation effects, Density, Frequency, Desert plants, Dams, Deterioration, Pasture management.
Identifiers: *Australia, *South Australia.

The investigation was concerned with description and analysis of vegetation change in arid areas subjected to many years of grazing. A hypothesis under study indicated that vegetation change would be patterned on the stocking pressure in the area. In arid lands this would imply that radial gradients would appear around water sources. Vegetation within a 2000-yd radius of a stock water dam was investigated. Stocking did not appear to have a pronounced effect on the majority of the species within the study area, however several species did demonstrate significant linear regressions between density and radial distance from the water. These observations substantiate the findings of Osborn, Wood, and Paltridge regarding stocking and vegetation gradients with respect to water. (Carr-Arizona)

SIZE OF FARM IN RELATION TO IRRIGATION PUMPING COSTS,
Idaho Univ., Moscow. Dept. of Agricultural Engineering.
G. L. Corey.
American Society of Agricultural Engineers, Transactions, Vol 12, No 6, p 795-797, November-December 1969. 6 tab, 9 ref.

Descriptors: *Farms, *Pumping, *Irrigation water, *Costs, *Economics of scale, Arid lands, Idaho, Farm management, Deep-well pumping, Ground water, Irrigation efficiency, Water table, Variability, Variable costs, Rotations, Size, Drawdown, Cost-benefit analysis, Crop production, Unit costs, Computers.
Identifiers: *Farm size, Unit basis, Snake River Basin, (Ida).

Large areas of arid land in Idaho have been developed for irrigation over the past 15 years. This development generally has involved high-lift pumping. As the water table is lowered, irrigation will become more expensive due to pumping costs. The purpose of this study was to determine if farm size affected the amount of revenue a producer could pay for water on a unit basis. A synthetic firm approach was used and a definite pattern of decreasing costs with increasing farm size was established. Based on the model, a table is included giving maximum pumping lift utilizing the revenue available for water. (Carr-Arizona)

LAGOON LEVELING TO PERMIT ANNUAL CROPPING IN SEMIARID AREAS,
Agricultural Research Service, Akron, Colo. Central Great Plains Field Station.
Rome H. Mickelson, and B. W. Greb.
Journal of Soil and Water Conservation, Vol 25, No 1, p 13-16, January-February 1970. 4 p, 3 fig, 3 tab, 6 ref.

Descriptors: *Land management, *Water conservation, *Playas, *Lake basins, *Land reclamation, *Land forming, Drainage, Watershed management, Land development, Soil management, Great Plains.
Identifiers: Lagoon leveling, Prairie potholes.

On the west-central Great Plains lie numerous irregularly shaped basins commonly referred to as lagoons, potholes, swales, or playas. These small depressions are usually 2 to 5 feet below the surrounding land and collectively comprise less than 1% of the region's total land area. They have no natural drainage outlets and intermittently become shallow ponds. Lagoon leveling converted a non- to low-productive area to a moderately productive area by providing more uniform distribution of impounded water over a larger surface area. Water supplies were adequate to permit annual cropping of forage crops in the leveled lagoon, and dry matter yields were increased 25% over those on unleveled dryland areas. A farmer can expect to recover an investment of $90 to $100 per acre in leveling costs within a period of 4 to 6 years, given normal rainfall and good management practices. (Knapp-USGS)

EFFECTS OF SMALL STRUCTURES ON PEAK FLOW,
Soil Conservation Service, Fort Worth, Tex. Engineering and Watershed Planning Unit.
Charlie M. Moore.
In: Effects of Watershed Changes on Streamflow, Water Resources Symposium No 2, Austin, Texas, October 1968, p 101-117, University of Texas Press, Austin and London, 1969. 17 p, 11 fig, 1 tab, 6 ref.

Descriptors: *Flood control, *Small watersheds, *Dams, Spillways, Watershed management, Rainfall-runoff relationships, Hydrograph analysis, Computer models, Peak discharge.
Identifiers: Small flood control structures.

The effects of small flood-control structures on peak flow are described. A typical floodwater-retarding structure consists of an earth dam, a drop-inlet principal spillway, and an open-channel emergency spillway. The emergency spillway consists of an inlet channel, a control section, and an exit channel. Subcritical flow exists in the inlet channel and the flow usually is supercritical in the exit channel. Dams are of small to medium size, with embankment heights ranging generally from 20 to 60 feet. A few approach or exceed 100 feet. Their drainage areas range from less than 1 sq mi to more than 50 sq mi, but most measure from 1 to 20 sq mi. Their storage capacity may be as much as 12,500 acre-ft for floodwater detention and 25,000 acre-ft total for combined uses. The capacities of most of the structures built to date range generally from 500 to 2,000 acre-ft. A study was made on Escondido Creek, near Kenedy, Texas, where 50% of the upstream structures had been completed on the 74,880-acre project. The Escondido Report includes a detailed analysis of the August 28-29, 1946, storm. It was determined that the natural peak discharge of 22,700 cfs was reduced by the effect of SCS flood-detention reservoirs to 14,600 cfs. (See W70-04723). (Knapp-USGS)

STORAGE REQUIRED FOR DIFFERENT TYPES OF STREAM FLOW REGULATION,
Mirko Melentijevich.
In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 656-667, 1966. 12 p, 8 fig, 7 ref.

Descriptors: *Water storage, *Reservoir operation, *Regulation, *Reservoir design, *Streamflow forecasting, Probability, Statistical methods, Inflow-outflow analysis, Hydrographs, Correlation analysis, Monte Carlo method, Stochastic processes, Markov processes.
Identifiers: Probability density function.

Reservoir design is discussed for situations in which the outflow is the same as the average inflow, the outflow is varied with the inflow, the outflow varies with the amount of water storage in the reservoir, and the outflow is varied both with the inflow and with amount of storage in the reservoir. The basic equations for each of these four cases are derived. Also the general equation for all four cases is given. The equations for probability density function of storage and for mean, variance, and skewness of the range of storage are given for the case when inflow minus outflow is a normal independent variable with zero mean and a variance of unity. The equations are given for the case of serial correlation between inflows. The effect of autocorrelation of streamflow is being investigated by the use of a Monte Carlo procedure, for streamflows which are first order Markov processes. (Knapp-USGS)
W70-04744

DETERMINATION OF THE REQUIRED RESERVOIR STORAGE FOR IRRIGATION UNDER THE CONDITIONS OF COMPENSATION DRAFT,
Zdenek Kos.
In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 668-682, 1966. 15 p, 6 fig, 14 ref.

Descriptors: *Water storage, *Reservoir design, *Reservoir yield, *Streamflow forecasting, *Irrigation water, Probability, Statistical methods, Economics, Optimization, Water requirements.
Identifiers: Czechoslovakia.

When regulating runoff by means of reservoirs it is often necessary to use the compensation draft. This method of regulation is often used especially for irrigation purposes. Under the conditions of a semi-humid climate, as is the case in the largest part of Czechoslovakia, it is necessary to consider irrigation only when the required drafts can be obtained at relatively low cost. A method for the determination of the degree of securing of the water-economy system function is based on Potapoff's graphical estimation of exceedance probabilities. The method has been considered for a number of different cases starting with the simple and proceeding to the more complex ones. The simplest of these cases is that of a system consisting of a single reservoir used for compensation draft for irrigation consumption which is considered centered in a single profile. The hydrologic relationship between the diversion site and that of the reservoir is taken to be so strongly affected by the effects of the intermediate watershed and by time of flow that the flows filling the reservoir and those in the diversion site can be regarded as independent. (Knapp-USGS)

STORAGE OF THE FLOODS OF SMALL WATERCOURSES, (IN FRENCH),
Transdanubian water Authority, Szekesfehervar (Hungary).
Gy. Bukovszky.
English summary included. In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 699-706, 1966. 8 p, 8 fig, 8 ref.

Descriptors: *Reservoir design, *Flood control, *Reservoir storage, *Streamflow forecasting, Water management (Applied), Model studies, Analog models, Reservoir operation, Small watersheds, Regulation.
Identifiers: *Hungary, Flood storage reservoirs.

On the basis of the meteorological conditions existing in Hungary, storage reservoirs for flood retention are classified into reservoirs for snowmelt-flood retention and reservoirs for stormwater. Solution of the storage equation is discussed. In the case of an open spillway with vertical walls there is a linear relationship between the stored volume and spillway overflow. This relationship is akin to the Muskingum equation, and to the linear relationship established for characteristic riverbed stretches by Kalinin, but whereas the Muskingum coefficient of proportionality depends on the hydrograph, the Kalinin coefficient is determined in advance by the physical characteristics of the storage reservoir and the spillway. The linear relationship permits the use of electric analogs and in the case of a closed spillway the relationship can be linearized. (Knapp-USGS)

QUEUING THEORY AND MULTIPLE-PURPOSE RESERVOIR DESIGN,
Institut fuer Wasserwirtschaft, Berlin (East Germany).
S. Dyck, and M. Schramm.
In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 707-710, 1966. 4 p, 1 ref.

Descriptors: *Reservoir design, *Streamflow forecasting, *Statistical methods, *Probability, Water storage, Runoff forecasting, Mass curves, Queuing theory, Linear programming, Hydrologic data, Depth-area-duration analysis, Rainfall-runoff relationships.
Identifiers: *Germany.

Seasonal changes of streamflow and sequential correlations between months are considered by duration curves of monthly flows. Considering the release rule and the storage capacity, 12 separate sets of queuing equations are set up to be solved as a simultaneous system of equations. In this system the available flood control storage may change from month to month. The solution of the 12 sets of equations produces the frequency distribution of storage, the probability of spilling, and the probability of being empty for each month of the year. The total probability of guarantee of the reservoir yield follows from the probability of the 12 months, considering the rules of the probability theory. The probability routing and the simultaneous solution of all 12 months are solved by an electronic computer. (Knapp-USGS)

CERTAINTY OF STREAM-FLOW CONTROL WITHIN A LIMITED PERIOD OF TIME,
Toronto Univ., (Ontario). Dept. of Mechanical Engineering.
Vit Klemes.
In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 711-719, 1966. 9 p, 3 fig, 19 ref.

Descriptors: *Reservoir operation, *Water management (Applied), *Streamflow forecasting, *Cost-benefit analysis, *Probability, Statistical methods, Optimization, Regulation, Flood control, Reservoir design, Synthetic hydrology, Model studies, Mathematical models.
Identifiers: *Czechoslovakia.

Present methods of streamflow control calculations, both deterministic and probabilistic, determine the certainty (or the risk) of the regulated outflow from a reservoir in relation to a long, practically unlimited period of time assuming a stationary regime of regulation. As a characteristic of certainty, we obtain one numerical value which, however, does not say much about the question of prime interest, that is, about the certainty of the given draft during the period, (say, 20-30 years) since reservoir operation began. Using this long-term certainty and carrying out the cost-benefit analysis for a 100-years period, we seem to have a deep knowledge of what will happen in the far-off future. In fact, our present optimal solutions will hardly remain optimal after 20-30 years because of changes in technology, relation of prices, etc. The system which is proposed to meet its conditions of optimality after 100 years is thus not based on a realistic concept. The best methods for studying these problems are probabilistic methods of streamflow regulation, especially the methods based on simulation of synthetic flow series. However, some problems of this kind can be analyzed also by means of deterministic methods. An example shows how the certainty distribution caused by the initial filling of a reservoir can be obtained for a given chronological series, using the deterministic method. (Knapp-USGS)
W70-04749

FLOOD PREVENTION BY ENLARGEMENT OF FLOOD WAVE SUBSIDENCE,
J. W. Van der Made.
In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 720-738, 1966. 19 p, 9 fig, 2 tab, 3 ref.

Descriptors: *Flood routing, *Flood control, *Channel improvement, Flow control, Water management (Applied), Water spreading, Channel morphology, Hydraulics, Waves (Water).
Identifiers: *Flood wave subsidence.

It is a well-known phenomenon, that, when moving downstream a flood wave on a river subsides. This subsidence is a consequence of the difference between the gradient of the water level before and behind the wave crest. The gradient before the crest is steeper than behind it, so the quantity of water discharged at the front is larger than the supply at the back. Subsidence of the wave crest is the result. This subsidence is determined by the variation of the gradient in the stream direction, and by the sharpness of the peak. For a flood wave this sharpness depends on the width in which this volume is stored. If the same quantity of water is distributed over a larger width, the length of the flood wave will decrease, and the wave crest will become more peaked. As a consequence the extent of subsidence will be larger. (Knapp-USGS)

EMPIRICAL METHOD FOR DETERMINATION OF STORAGE RESERVOIR CAPACITY,
State Inst. of Hydrology and Meteorology, Krakow (Poland).
Wlodzimierz Meyer.
In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 651-655, 1966. 5 p, 9 ref.

Descriptors: *Reservoir operation, *Reservoir yield, *Water storage, *Reservoir storage, *Runoff forecasting, Routing, Streamflow forecasting, Inflow, Statistical methods, Hydrographs.
Identifiers: *Poland.

An empirical formula was derived for computation of the useful capacity of retention reservoirs in Poland. Mean annual discharge for long periods, discharge variability, the mean longitudinal slope of the river valley, the amount and guarantee of runoff, and an index characterizing the variability of the yearly water input to the reservoir are used as data. The formula was derived on the basis of the cases of steady or variable annual discharge from the reservoir, assuming that the reservoir is used for water power, amelioration and inland navigation. However, the index characterizing the variability of input used in the formula is of general character, and applies also to other cases of runoff variability. A nomogram for the formula makes it easier to perform the computations in practices. (Knapp-USGS)

EFFECT OF CHANNEL STRAIGHTENING ON THE MOVEMENT OF FLOOD WAVES ON BOYER RIVER,
Iowa State Water Resources Research Inst., Ames.

Surendera Kumar, and Howard P. Johnson.
Available from the Clearinghouse as PB-190 355, $3.00 in paper copy, $0.65 in microfiche. Partial Completion Report, Iowa State Water Resources Research Institute, January 15, 1970. 101 p, 5 tab, 31 fig, 33 ref, 2 append. OWRR Project No. B-005-IA.

Descriptors: Watershed hydraulics, Drainage, Iowa, *River flow, Channel flow, Channel improvement, Flood control, *Drainage effects, Controlled drainage, *Discharge (Water), Mannings equation.
Identifiers: Boyer River, *Flood waves.

Many Iowa rivers have been straightened and leveed with the objective of achieving drainage and flood control on the riparian land. Although these methods have proved beneficial to the land along the reach straightened, they have often resulted in damage to the downstream land owner's property by increasing the discharge, thus forcing the downstream owners to repair or improve their part of the channel. Litigation among drainage districts often results with downstream districts claiming partial reimbursement of the construction and maintenance costs from the districts upstream. This study was conducted to evaluate the physical effects of river straightening on the movement of flood waves with the objective of arriving at a method for the equitable apportionment of construction and maintenance costs among beneficiaries. A DYNAMIC MODEL OF THE ECONOMY OF THE SUSQUEHANNA RIVER BASIN,
Battelle Memorial Inst., Columbus, Ohio.
H. R. Hamilton, S. E. Goldstone, F. J. Cesario, D. C. Sweet, and D. E. Boyce.
Final Rep, Susquehanna River Basin Group, August 1966. 25 p, 14 fig, 11 tab, 12 append.

Descriptors: *Mathematical models, *Economics, *River basins, *Water utilization, *Water resources development, Investment, Water quality, Water shortage, Population, Employment, Social aspects.
Identifiers: Susquehanna River.

The report summarized a three-phase research program during which a dynamic mathematical model of the economy of the Susquehanna River Basin was developed. The model integrated population, employment, and water resource variables that had been treated independently previously and was capable of generating economic and water-use projection for the Basin under a wide variety of alternative assumptions. Major conclusions of the study were (a) the water resource of the Basin appeared adequate to support economic growth for the foreseeable future without the construction of major systems of river works, (b) water quality in the Basin was generally good, (c) investment in water treatment and distribution systems than by a shortage of water resources, and (d) the usefulness of a computer simulation for regional economic and regional resource studies was demonstrated. METHODS FOR FORECASTING OF WATER INFLOW TO RIVERS AND RESERVOIRS,
Hydrometeorological Centre, Moscow (USSR).
E. S. Zmieva.
In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 641-650, 1966. 10 p, 5 fig, 17 ref.

Descriptors: *Streamflow forecasting, *Water management (Applied), Runoff forecasting, Routing, Reservoir design, Regulation, Water balance, Hydrologic budget, Flood routing, Model studies, Water storage, Reservior yield, Safe yield.
Identifiers: *USSR.

The methods for forecasting water inflow to reservoirs in the USSR are considered using the Volgo-Kama hydro-electric power stations as an example. The methods for forecasting are based on water balance of catchment areas. A series of correlative relationships is presented in the form of diagrams or empirical formulas. Equations of water balance of the reservoirs and section of the river between the two hydrometric gages as well as the data of river runoff, feeding a reservoir or a river section, are used to calculate water inflow. Flood wave transformation is taken into account be means of lag-time curves. Calculations are carried out on an analog computer or electronic computers. (Knapp-USGS)

GENERALIZED EVALUATIONS OF THE PROBABILITY OF RESERVOIR EMPTINESS WITH GAUSSIAN OR GAMMA INPUTS FOR THE TWO-SEASON CASE,
Water Research Association, Medmenham (England).
Jennifer Jones, and J. A. Cole.
In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 611-618, 1966. 8 p, 6 fig, 2 ref.

Descriptors: *Reservoir yield, *Reservoir storage, *Statistical methods, Draft-storage curves, Probability, Water-level fluctuations, Safe yield, Reservoir yield, Reservoir operation, Water management (Applied).
Identifiers: Reservoir depletion probability.

The long-term probability of emptiness of a reservoir is calculated for various possible inputs. The input frequencies are given by four parameters that define Gaussian or gamma functions for the gain and depletion seasons. By expressing the reservoir volume in ratio to the average annual gain, the computed results may be expressed in dimensionless fashion. (Knapp-USGS)

ON THE SAFETY GIVEN BY A SEASONAL REGULATION RESERVOIR. (IN FRENCH),
Electricite de France, Chatou. Centre de Recherches et d'Essais.
J. Bernier.
In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 575-589, 1966. 15 p, 3 fig, 7 ref, append.

Descriptors: *Reservoir operation, *Water management (Applied), *Water storage, *Safe yield, *Statistical methods, Markov processes, Reservoir yield, Runoff forecasting, Regulation, Multiple-purpose reservoirs, Probability.
Identifiers: Reservoir operation policy.

Various methods for determination of the safe yield of a storage reservoir are discussed. It appears that all the usual methods are based upon different definitions of the safety and therefore solve different problems. The definition of safe yield based upon the probability of failure is discussed and methods based upon the theory of Markov processes are presented. The safe yield of a reservoir clearly depends on the operation policy, particularly in the case of multipurpose reservoir. (Knapp-USGS)

APPLICATIONS OF TWO-SEASON STATISTICS TO RESERVOIR YIELD CALCULATION,
Water Research Association, Medmenham (England).
J. A. Cole.
French summary included. In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 590-597, 1966. 8 p, 3 fig, 4 tab, 13 ref.

Descriptors: *Reservoir yield, *Statistical methods, Reservoir operation, Water management (Applied), Probability, Safe yield, Runoff forecasting, Regulation, Computers.
Identifiers: Net additions to storage.

Moran's transition matrix theory is applied to a water reservoir by considering seasons of irregular length with alternating gain and loss of contents. The method is illustrated for the case of an off-channel reservoir replenished from a river, using pumps of limited capacity, but is shown to be more generally applicable. Using Lloyd's bivariate matrix procedure, the importance of serial correlation of seasonal inflows is assessed, and an empirical adjustment of the probability of emptiness is established. (Knapp-USGS)

DISPOSABLE VOLUMES AND FLOW CONTROL IN HYDROELECTRIC RESERVOIRS. (IN FRENCH),
Electricite de France, Grenoble. General Technical Div.
M. M. Lugiez, and Andre Douillet.
In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 598-610, 1966. 13 p, 3 fig, 2 tab.

Descriptors: *Reservoir yield, *Reservoir operation, *Draft-storage curves, Electric power, Water levels, Water storage, Statistical methods, Stage-discharge relations, Reservoir storage, Water management (Applied).
Identifiers: France, Reservoir capacity.

Control of water in hydroelectric reservoirs requires an accurate knowledge of the relation between storage and water level. Determination of this relation is actually done by Electricite de France from stereophotographs taken from an aircraft, combined with the use of an electronic computer which determines the elementary surfaces and then the volumes. Measurements made with manometers need important corrections to take into account variations of atmospheric pressure, density and compressibility of water. In some places, the disposable volume in a reservoir can change considerably in time because of silting. When the reservoir cannot be drained off entirely, bottom topography is determined by means of 'ultrasonics' emitted from a boat. When the reservoir can be entirely drained off, volumes of sediment are determined by means of periodical stereophotographs from an aircraft. Stream-gaging by dilution methods is very useful. Study of floods is facilitated by use of information from a system of automatic measurement stations located within the drainage basin above the reservoirs. (Knapp-USGS)

PROBABILISTIC RESERVOIR DESIGN,
Lancaster Univ., Bailrigg (England). Dept. of Mathematics.
E. H. Lloyd.
French resume included. In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 619-625, 1966. 7 p, 19 ref.

Descriptors: *Water management (Applied), *Reservoir design, *Simulation analysis, *Probability, Markov processes, Stochastic processes, Statistical methods, Streamflow forecasting, Reservoir yield, Safe yield.
Identifiers: Autocorrelation.

Methods of calculating probabilities of reservoir contents by statistical methods are reviewed. The models describing reservoir filling are stochastic, autocorrelative, and seasonal. Systems involving several streams and reservoirs, in which flood prevention, flow regulation, drought-remedial water storage, power generation, recreation, and other uses are planned, can at present be dealt with only by simulation. The method discussed analyzes single-purpose single reservoir systems by probability theory and suggests methods of extension by models. (Knapp-USGS)

APPLICATION OF A METHOD BASED ON THE CALCULUS OF PROBABILITY IN THE ELABORATION OF HYDROLOGIC DATA,
Ente Nazionale per l'Energia Elettrica, Venice (Italy).
Giorgio Conci.
French resume included. In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 626-632, 1966. 7 p.

Descriptors: *Water management (Applied), *Reservoir design, *Streamflow forecasting, *Statistical methods, Probability, Reservoir yield, Safe yield, Hydrologic data, Stochastic processes, Optimization.
Identifiers: Reservoir yield forecasting.

To determine the exact capacity of a hydro-electric reservoir it is necessary to know both the precise water availability at chosen degrees of industrial risk, and their exact annual distribution. The presence of an anomalous year can alter the exact determination of hydraulically available resources, and the common application of the distribution of the standard year cannot be considered thoroughly reliable as it may often been based on an entirely coincidental occurrence. Correct determination of water availability is discussed. Such results are easily obtainable by applying a method based on the calculus of probability to obtain an expression for planning the most economical oversize to be assigned to the reservoir in order to safely allow variations of distribution. (Knapp-USGS)

REGIONAL INTEGRATION OF SURFACE AND GROUNDWATER RESOURCES,
California State Dept. of Water Resources, Los Angeles.
Thelma A. Johnson, and Helen J. Peters.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 493-499, 1967. 7 p, 1 fig.

Descriptors: *Conjunctive use, *California, *Water resources development, Water management (Applied), Optimum development plans, Economics, Planning, Water storage, Water rights.
Identifiers: *California Water Plan.

California's surface and groundwater resources have been developed separately with a minimum of conjunctive operation. Groundwater development has been local, while surface water development and transportation has extended to large developments with major transportation systems. The California Water Plan outlines far-future development of surface and groundwater resources, but the Plan does not provide a staged development. Current continuing staging studies are designed to produce and continually refine a time-related economic plan to meet California's water needs. Full integration of the groundwater and surface water resources of yield, storage capacity, water-in-storage and transmission capacity are necessary for proper project staging. The planned integration must be staged with a proper framework of economic criteria. Economic criteria and possible alternative physical possibilities are explored. Some project purposes, benefit measurement techniques, and economic demand techniques are identified. Successive approximation steps in applying the economic criteria are outlined. Questions of conflict between economic benefits and costs at the local and at the regional level and administrative considerations are explored. (Knapp-USGS)

INVESTIGATIONS ON WATER QUALITY AT ARTIFICIAL RECHARGE OF GROUNDWATER,
Public Health and Epidemiology Station, Miskolc (Hungary); and Public Health Inst., Budapest (Hungary).
A. Fazold, Zs. Biro, S. Takacs, and K. Schiefner.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 271-277, 1967. 7 p, 4 fig, 1 tab, 2 ref.

Descriptors: *Water storage, *Artificial recharge, *Pit recharge, Water spreading, Water treatment, Flooding, Unsteady flow, River flow, Observation wells, Water quality, Water levels, Dissolved oxygen.
Identifiers: *Hungary.

Five years of research on the chemical, biological and bacteriological changes at artificial recharge of groundwater showed that the periodical operation of a new recharge basin has a harmful effect on the water quality in a coarse sandy-pebble aquifer, and the minimal distance between the wells and recharge basins should be 50 meters. In the case of a short retention of recharge water in the ground, the free carbonic acid, the total hardness, the iron and manganese decrease, and the quantity of the dissolved oxygen and the pH-value increase. In a long retention the free carbonic acid and iron content will rise, the quantity of dissolved oxygen will not vary, and the value of pH will decrease. (Knapp-USGS)

ARTIFICIAL FORMATION OF FRESH GROUNDWATER LENSES BY MEANS OF WELLS,
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
I. S. Glazunov.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 237-242, 1967. 6 p, 2 fig.

Descriptors: *Artificial recharge, *Recharge wells, *Saline water-freshwater interfaces, Water storage, Aquifers, Groundwater movement, Water yield, Saline water intrusion.

Identifiers: Fresh water lenses.

The problems of artificial formation of new fresh groundwater lenses as well as replenishment of existing ones by means of a system of fully penetrating recharge and pumped wells are discussed. The technique allows formation of the lateral boundary of a lens to be calculated. The calculation relationships have been obtained for constant and exponentially changing flows of recharge wells. Piston-like displacement of saline water by fresh water is assumed. Solutions are given for 3 recharge wells at the corners of an equilateral triangle, 3 recharge wells in the corners of an equilateral triangle with a pumped well in the center, 4 recharge wells in a quadrangle, and 4 wells in a quadrangle with a pumped well in the center. (Knapp-USGS)

CLARIFICATION OF TURBID WATER WITH POLYELECTROLYTES FOR RECHARGE THROUGH WELLS,
Technion-Israel Inst. of Tech., Haifa. Sanitary Engineering Lab.; and Agricultural Research Service, Bushland, Tex. Southern Plains Branch.
M. Rebhun, and V. L. Hauser.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 218-228, 1967. 11 p, 9 fig, 8 ref.

Descriptors: *Artificial recharge, *Water treatment, *Coagulation, Electrolytes, Clays, Turbidity, Injection wells, Permeability, Filtration, Texas, Playas, Water spreading.
Identifiers: Polyelectrolyte coagulation.

Storm runoff water is a good source of additional water supply for arid and semiarid regions; however, it must be stored for later use. Storage of these waters in aquifers by artificial recharge is hindered by suspended solids in the water. For recharge by injection through wells, removal of suspended solids must be nearly complete. Polyelectrolyte flocculants effectively clarify suspensions typical of flood runoff water. A simple field system was built and tested, and all elements of a complete system including treatment with polyelectrolytes, a simple clarification system, and groundwater recharge through wells were combined into a successful operating unit. (Knapp-USGS)
W70-04609

A FRESH-WATER CANAL AS A BARRIER TO SALT-WATER INTRUSION,
Alberta Univ., Edmonton; and Georgia Inst. of Tech., Atlanta. School of Civil Engineering.
Srisakdi Charmonman, M. R. Carstens, and George D. May.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 374-382, 1967. 9 p, 4 fig, 2 tab, 6 ref. OWRR Project B-003-GA.

Descriptors: *Artificial recharge, *Saline water intrusion, *Groundwater barriers, *Canal seepage, Groundwater movement, Saline water-freshwater interfaces, Aquifers, Coasts, Canals, Deltas.
Identifiers: Saline water barriers.

The seepage flow pattern is determined for flow from a fresh-water canal which parallels the sea. Numerical results are presented for cases in which the fresh-water seepage from the land is a small fraction of the fresh-water seepage from the canal. In other words, the fresh-water flow from the canal acts as a dam forcing the interface between the sea water and the fresh water down to a lower elevation. The solution of Laplace's equation is obtained by numerical methods for this flow situation with the boundary conditions involving a water table and a density interface. The possibility of using a fresh-water canal for agricultural reclamation of sea-water intruded deltas and marshes is discussed. (Knapp-USGS)
W70-04610

FORMATION OF FRESH GROUNDWATER LENSES AS A RESULT OF PERCOLATION FROM CANALS AND PITS,
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
V. D. Grodzensky.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 360-364, 1967. 5 p, 2 fig.

Descriptors: *Saline water-freshwater interfaces, *Artificial recharge, *Irrigation water, Pit recharge, Canal seepage, Infiltration, Groundwater movement, Water quality, Water levels.
Identifiers: *USSR, Fresh-water lenses.

The formation of fresh water lenses in saline aquifers by canal or pit infiltration is analyzed. Analytical relationships are developed to show water movement, interface movement, and the effects of varying water density. The solutions obtained were verified by comparison with results of a Hele-Shaw model study. (Knapp-USGS)
W70-04611

DRAINAGE OF A SALINE-WATER AQUIFER RECHARGED BY FRESH WATER,
Windsor Univ. (Ontario). Dept. of Civil Engineering and Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
D. E. L. Maasland, and M. W. Bittinger.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 350-359, 1967. 10 p, 5 fig.

Descriptors: *Saline water intrusion, *Aquifers, *Recharge, *Hydraulic models, Model studies, Groundwater movement, Permeability, Saline water-freshwater interfaces, Drainage, Water yield, Mixing, Salinity.
Identifiers: *Hele-shaw models.

The effluent from drains in a saline water aquifer recharged with fresh water is a mixture of salt and fresh water. A Hele-Shaw model study was conducted to determine the rate of quality change of drain effluent for various conditions of drain spacing, thickness of aquifer, permeability, and recharge rate. A uniform aquifer, a layered aquifer (top layer 12 times as permeable as the bottom), and a layered aquifer (bottom layer 6 times as permeable as the top) was studied. Results are presented in the form of dimensionless charts, containing such variables as drain spacing, thickness of aquifer, permeability, recharge rate, and porosity. The charts are used to predict the salt concentration of the drain effluent at any time for various magnitudes of the variables. (Knapp-USGS)

ECONOMICS OF ARTIFICIAL RECHARGE FOR MUNICIPAL WATER SUPPLY,
Resources for the Future, Inc., Washington, D.C.
Richard J. Frankel.
Artificial Recharge and Management of Aquifers, Symposium of Haifa (March 19-26, 1967), International Association of Scientific Hydrology, Publication No 72, p 289-301, 1967. 13 p, 1 fig, 5 tab, 44 ref.

Descriptors: *Water reuse, *Artificial recharge, *Tertiary treatment, *Reclaimed water, *Economic feasibility, Cost-benefit analysis, Water demand, Water requirements, Arid lands, Humid lands.
Identifiers: Washington (D.C.).

A research project was undertaken to determine whether or not waste reclamation could be economically competitive with other water sources for municipal water supply. Numerous advanced waste treatment systems and recycle schemes were evaluated. Waste-water renovation through groundwater recharge proved to be the most feasible solution to reclamation of the effluent of any type treatment plant today. Further study has evaluated the chemical and physical limitations of artificial recharge using municipal wastes; the economic trade-offs between additional treatment prior to recharge and greater land utilization; and the break-even point for land values as a function of economics of scale. Finally the economics of a particular case-study in the arid West of the United States is discussed as well as proposed scheme for converting the nation's capital, Washington, D.C., in the humid East from using solely surface water supplies to using artificial recharge of undeveloped aquifers for future expansion of water supplies. ECONOMIC ASPECTS OF GROUND-WATER BASIN CONTROL,
Louisiana Water Resources Research Inst., Baton Rouge.
Laurence H. Falk.
Available from the Clearinghouse as PB-190 196, $3.00 in paper copy, $0.65 in microfiche. Louisiana Water Resources Research Institute Bull. GT-3, La. State Univ, Baton Rouge, 1970. 76 p, 9 tab, 14 fig, 79 ref, append. OWRR Projects B-001-LA, B-003-LA and B-005-LA.

Descriptors: *Marginal costs, *Capital costs, Cost comparisons, *Conjunctive use, Alternative costs, Water rights, Water management (Applied), Resource allocation, Economic efficiency, Prices, Discriminatory pricing, Water transfer, *Assessments, Tax rate, *Discount rate, Interest rate, *Cost-benefit analysis, *Benefit-cost ratio.

Existing water laws allow the misallocation of water because it is not being put to its most valued uses. Water should be subject to unconditional ownership and purchased or sold at will as long as the price reflects its marginal social cost. The present-value unit cost of replacement water produced by a private project will be less than that produced by a non-profit community project because of the corporate income tax structure, if the cost of capital is the same and the returns to outlay are constant. However, owing mainly to unequal discount rates, a community project will be more favorable, according to the benefit-cost ratio between the cost of purchasing water from the community project and the cost of the community project. Differences between the community and the national social discount rates will generally give ambiguous comparisons of economic efficiency. In Los Angeles County, water resources are misallocated because ad valorem taxes partially finance variable production costs. In additon, the prices of water imported

by the Metropolitan Water District have not reflected the marginal social costs. Efficiency could be restored by: use of pumping charges instead of ad valorem taxes; discontinuance of mandatory sales of surplus-water rights; institution of bidding for water rights; and setting of firm prices for imported water.

LAND SUBSIDENCE RELATED TO GROUNDWATER OFFTAKE IN THE NEW ORLEANS AREA,
Louisiana State Univ., Baton Rouge.
Raphael G. Kazmann, and Marla M. Heath.
In: Transactions-Gulf Coast Association of Geological Societies, Vol. XVIII, 1968, p. 108-113, 8 fig, 6 ref.

Descriptors: *Groundwater, *Artificial recharge, *Land subsidence, *Withdrawal, *Overdraft, Aquifers, Groundwater recharge, Subsidence.
Identifiers: *New Orleans.

The land surface of the New Orleans area is subsiding in a manner similar to that of other deltoric deposits in the Gulf Coast Plain. Superimposed on this broad subsidence pattern is another (more local in nature) that is associated with the lowering of the piezometric surface of the principal aquifer of the area, the '700-foot' sand. Published elevations of bench marks show an elevation decrease of as much as 1.7 feet between 1938 and 1964. The long-term implications to the city of New Orleans of the subsidence produced by groundwater offtake are significant. The land surface is already so low that additional subsidence should not be tolerated. Groundwater offtakes should not be increased; if possible, groundwater production within the area should be curtailed. If the aquifers (primarily the '700-foot' sand) are to be used in the future, they should be artificially recharged to reduce the net withdrawal of water. Four recommendations for detailed analysis of this phenomenon are forwarded: (1) present studies of local groundwater conditions should be immediately expanded and intensified; (2) the present bench mark system should be expanded; (3) the bench marks should be relevelled more frequently than in the past; and (4) the level lines should be tied and adjusted to stable inland bench marks. THE PRESENT AND FUTURE GROUNDWATER SUPPLY OF THE BATON ROUGE AREA,
Louisiana Water Resources Research Inst., Baton Rouge.
Raphael C. Kazmann.
Available from the Clearinghouse as PB-190 358, $3.00 in paper copy, $0.65 in microfiche. Louisiana Water Resources Research Institute, Bulletin No. 5, Feb. 1970. 126p, 18 fig, 17 tab, 18 ref, 6 append. OWRR Projects A-001-LA; A-004-LA; B-001-LA thru B-005-LA.

Descriptors: *Water supply, *Groundwater, *Surface waters, Aquifers, Groundwater recharge, Saline water intrusion, Hydrogeology, *Water spreading, Water quality, Water management (Applied), *Land subsidence, *Economic efficiency, *Water costs, Marginal costs, Discount rate, *Legislation, *Water law, Reparian rights, *Water transfer, Reasonable use, Administrative agencies, River flow, Systems analysis, Pipelines, Amite River (La), Baton Rouge (La).

A principal Baton Rouge aquifer has become degraded by saline water that is drawn by heavy industrial pumping from a trapped source west of the offtake area. Because this water moves through a geological constriction, its flow is limited. Further northward movement can be halted by pumping it from waste wells. Later, injection of fresh water from a shallower aquifer, which is hydraulically connected to the Mississippi River, could form a pressure barrier against eastward flow. The maximum land subsidence resulting from continued drawdowns in the 10 presently-used aquifers may reach 5 feet. Fresh water imported from the Amite River is proposed as the future supply. This water, after its infiltration in spreading grounds, would be withdrawn through wells and then transported by pipeline to the industrial area. For peak-demand storage, part of this water could be injected into several aquifers, which would then serve as short-distance distributaries. Proposed legislation concerning water rights and administrative agencies, predicted water costs, an optimized pipeline system, and the hydrography of the Amite River are given in the appendices.

4C. Effects on Water of Man's Non-Water Activities

PREDICTING THE EFFECT OF CLEAR-CUTTING ON STREAM TEMPERATURE,
Oregon State Univ., Corvallis. School of Forestry.
George W. Brown.
Journal of Soil and Water Conservation, Vol 25, No 1, p 11-13, January-February 1970. 3 p, 2 fig, 2 tab, 10 ref.

Descriptors: *Water temperature, *Clear-cutting, Forest management, Cutting management, Land clearing, Lumbering, Watershed management, Heat budget, Solar radiation, Discharge (Water), Thermal pollution, Water pollution sources.
Identifiers: Stream temperatures.

The temperature change that occurs between two points on a stream is directly proportional to the surface area of the stream and the heat load applied between these points. It is inversely proportional to the flow. Good estimates of the heat load can be made with solar radiation data if the stream is uniformly exposed to sunlight. Foresters can use this technique to predict the effect of clear-cutting on stream temperature. (Knapp-USGS)

THE U. S. GEOLOGICAL SURVEY URBAN WATER PROGRAM,
Geological Survey, Washington, D.C. Water Resources Div.
William J. Schneider.
In: Effects of Watershed Changes on Streamflow, Water Resources Symposium, No 2, Austin, Texas, October 1968, p 165-168, University of Texas Press, Austin and London, 1969. 4 p.

Descriptors: *Planning, *Urbanization, *Data collections, *Water management (Applied), Research and development, Water resources development, Water supply, Waste disposal, Storm runoff.
Identifiers: U.S. Geological Survey, Urban hydrology.

The Water Resources Division of the U.S. Geological Survey is currently expanding its role in urban hydrology as rapidly as possible to meet new demands. Almost since the first stream-gaging stations were established, more than 80 years ago, water-resources data have been collected in urban areas. Today, some data are available for every one of the 222 standard metropolitan areas in the United States. In addition to the collection of basic data, the Water Resources Division has conducted studies either within or including urban areas. These have resulted in numerous reports published in the Survey publication series and in outside technical journals. In recent years, the emphasis of these studies has been on the assessment of changes in the water resources caused by urbanization. Storm drainage today is still largely designed on the basis of the empirical rational formula using rainfall intensity modified by a coefficient of runoff. The inefficiency of this method is well recognized. Greater knowledge of the part of the hydrologic cycle involving rainfall-runoff relations in urban environments is needed. A study, currently under way, will consider the data needs for urban runoff studies, appraise available and needed instrumentation for collection of these data, and advise on types of networks for collection of these data. This study is for design of pilot areas. (See W70-04723). (Knapp-USGS)

URBAN EFFECTS ON WATER YIELD,
Geological Survey, Menlo Park, Calif.
Arvi O. Waananen.
In: Effects of Watershed Changes on Streamflow, Water Resources Symposium No 2, Austin, Texas, October 1968, p 169-182, University of Texas Press, Austin and London, 1969. 14 p, 7 fig, 2 tab, 16 ref.

Descriptors: *Urbanization, *Rainfall-runoff relationships, *Storm runoff, *Water supply, Land use, Water yield, Hydrology, Hydrographs, Peak discharge, Hydrograph analysis, Meteorology, Sewers, Storm drains, Recharge, Sewage disposal, Waste disposal.
Identifiers: Urban hydrology, Urban meteorology.

Urban development has a significant impact on hydrologic relations. The results of various studies demonstrate the type and magnitude of many of the effects on yield. These may be summarized as including: (1) Increase in total yield from stormflow and in annual discharge: (2) decrease in base flow of those streams that remain under generally natural conditions; (3) modification of low flow of streams influenced by the importation of water, the use of which results in discharge of wastewater. This includes the increase of low flow in streams that receive septic-tank drainage, or effluents from sewage-treatment plants, or from industrial plants; (4) decrease in recharge to the underlying groundwater basins; and (5) increase in precipitation in urban areas and corresponding increase in yield.

The principal effect of urban development on yield is an increase in direct runoff. The cumulative effect of increase in stormflow from urban areas, particularly in regions of strip cities and the megalopolitan complexes developing in several areas, may be substantial on downstream receiving channels. (See W70-04723). (Knapp-USGS)
W70-04574

MODELING THE RUNOFF CHARACTERISTICS OF AN URBAN WATERSHED BY MEANS OF AN ANALOG COMPUTER,
Utah Water Research Lab., Logan.
J. Paul Riley, and V. V. Dhruva Narayana.
In: Effects of Watershed Changes on Streamflow, Water Resources Symposium No 2, Austin, Texas, October 1968, p 183-200, University of Texas Press, Austin and London, 1969. 18 p, 14 fig, 3 tab, 7 ref.

Descriptors: *Urbanization, *Rainfall-runoff relationships, *Computer models, *Analog models, Analog computers, Simulation analysis, Hydrograph analysis, Storm runoff, Peak discharge.
Identifiers: Urban hydrology, Austin (Texas).

In the synthesis of hydrograph characteristics of small urban watersheds, the distribution of the water among the various phases of the runoff process is attempted by the concept of 'equivalent rural watershed.' For a given input into both the models (Urban and its equivalent rural watershed), the outputs must be identical. The hydrograph of outflow from an urban watershed is obtained by chronologically deducting the losses due to interception, infiltration, and depression storage from precipitation on the equivalent rural watershed and then routing it through the surface and channel storages. This is being approached by computer simulation. Testing and verification of the basic mathematical model is being done by using observed rainfall and runoff data from well-instrumented runoff areas. Coefficients representing interception, depression storage, and infiltration are determined by the trial and error process on the analog computer in such a way that the outflow hydrograph predicted by the model is nearly identical to the measured prototype hydrograph. Relationships between these coefficients and various urbanization characteristics or parameters are established. Sensitivity studies which investigate the significance of each of the watershed coefficients on the outflow characteristics are also undertaken. (See W70-04723). (Knapp-USGS)
W70-04575

EFFECTS OF URBANIZATION ON PEAK FLOWS,
Michigan Univ., Ann Arbor.
E. F. Brater, and Suresh Sangal.
Research supported by FWPCA, Mich State Highway Dep and U. S. Bureau of Public Roads. In: Effects of Watershed Changes on Streamflow, Water Resources Symposium No 2, Austin, Texas, October 1968, p 201-214, University of Texas Press, Austin and London, 1969. 14 p, 8 fig, 36 ref.

Descriptors: *Urbanization, *Rainfall-runoff relationships, *Storm runoff, *Routing, Hydrograph analysis, Model studies, Mathematical models, Simulation analysis, Infiltration, Runoff, Overland flow, Peak discharge, Floods.
Identifiers: Urban hydrology.

Study of the effect of urbanization on peak flows requires the best possible knowledge of the runoff process. The volume of surface runoff is the rainfall minus infiltration and permanent retention. Some of the impermeable portions of basins result from urbanization and their magnitude must be considered in computing the infiltration capacity. Hydrologically significant impermeable area is probably smaller than the actual impermeable area, and there is evidence that it is related to population density. For basins near Detroit the significant value varies from 1% to 10%, for population densities varying from about 500 to 7,000 per square mile. Many routing techniques may provide the basis for a mathematical model of the hydraulics of storm runoff. One method of evaluating the influence of urbanization on the runoff hydrograph is to study relationships between unit hydrograph shape parameters and some measures of drainage basin characteristics. Much work has been and is being done to help find better ways of predicting peak flows from rainfall, and more emphasis is being placed on the determination of the effect of urbanization. (See W70-04723). (Knapp-USGS)

URBAN EFFECTS ON THE UNIT HYDROGRAPH,
Tracor, Inc., Austin, Tex.; and Texas Univ., Coll. of Engineering.
William H. Espey, Jr., David E. Winslow, and Carl W. Morgan.
In: Effects of Watershed Changes on Streamflow, Water Resources Symposium No 2, Austin, Texas, October 1968, p 215-228, University of Texas Press, Austin and London, 1969. 14 p, 10 fig, 4 tab, 15 ref. OWRR Project C-1098 (1590).

Descriptors: *Urbanization, *Storm runoff, *Hydrograph analysis, *Frequency analysis, Hydrology, Rainfall-runoff relationships, Peak discharge, Floods, Unit hydrographs.
Identifiers: Urban hydrology, Urban watersheds.

Summaries are presented of work concerning peak floods for urban areas and of a recent study concerning watersheds in Houston, Texas. Increased urbanization results in increased peak flows and accentuated high and low flows. Equations presented show that peak flows may be expected to increase from two to four times that of the flow from the undeveloped watersheds, depending upon the type of channel improvement, amount of vegetation in the channel, and the type of secondary drainage system. The capacity of the secondary drainage facilities may have a limiting effect on the peak discharge. (See W70-04723). (Knapp-USGS)

EXPERIENCE WITH THE EVALUATION OF URBAN EFFECTS FOR DRAINAGE DESIGN,
Turner, Collie and Braden Co., Inc., Houston, Tex.
Donald VanSickle.
In: Effects of Watershed Changes on Streamflow, Water Resources Symposium No 2, Austin, Texas, October 1968, p 229-254, University of Texas Press, Austin and London, 1969. 26 p, 17 fig, 4 tab, 17 ref.

Descriptors: *Urbanization, *Rainfall-runoff relationships, *Unit hydrographs, *Synthetic hydrology, Rational formula, Storm runoff, Peak discharge, Floods, Hydrograph analysis, Routing.
Identifiers: Houston (Tex), Urban hydrology.

An example is given of the adaptation of preliminary research data to the development of new drainage design criteria for a major metropolitan area. The new criteria should be closer to the actual needs than the old rational method criteria. The Houston metropolitan area, one of the most rapidly urbanizing areas in the United States, was used to establish and test new urban runoff criteria. In order to apply urbanization factor data to design, the following procedures are followed: (1) Develop the mean basin length and mean basin slope values from topographic maps; (2) estimate the degree of development anticipated in the watershed for the period of design; (3) estimate drainage density for each of the areas of use; (4) multiply the drainage density by the area for each type of land use to get total channel length; (5) determine the basin factor; (6) from the curves, determine the time to peak and the unit hydrograph peak for the degree of development involved; and (7) develop the unit hydrograph. A simpler way to use the criteria is to develop them as empirical curves of drainage area versus discharge, of specific use only in the urban area and for the storm frequencies for which they are designed. Synthetic unit hydrographs were prepared and tested for about 50 drainage areas in the Houston areas. (See W70-04723). (Knapp-USGS)

EFFECTS OF WATERSHED CHANGES ON STREAMFLOW,
Texas Univ., Austin. Dept. of Civil Engineering.
Walter L. Moore, and Carl W. Morgan.
Water Resources Symposium No 2, Austin, Texas, October 1968. Published by Univ of Texas Press, Austin and London, 1969. 289 p.

Descriptors: *Urbanization, *Rainfall-runoff relationships, *Hydrograph analysis, *Water quality, Flood control, Reservoirs, Water yield, Hydrologic budget, Planning, Water management (Applied), Hydrology, Floods, Peak discharge, Model studies, Hydraulic models, Mathematical models, Computer models, Analog models.
Identifiers: Urban hydrology.

This special lecture series was arranged to present the most advanced approaches to evaluating the effects of watershed changes on streamflow. To an increasing degree man's activities are altering the hydrologic characteristics of watersheds, both rural and urban, and it is urgent to know the character and extent of the changes and how they affect plans for development. Numerous field studies designed to evaluate the effect of specific watershed changes by comparisons between watersheds have been in operation for sufficient time to build up a significant length of record. New methods of computer simulation of watersheds have reached a stage of development to offer an attractive tool for attacking the problem in new ways. The effects of the changes can best be evaluated when the entire performance of the watershed is understood in detail. Then all of the physical processes can be followed and the performance of the watershed can be simulated by numerical or analog techniques which correspond to the physical processes. Watershed changes produce effects on both the amount and the quality of streamflow. The topics discussed include model studies, land treatment in rural watersheds, flood control structures, rural pollution, the effects of urbanization on peak flow, the effects of urbanization on water yield, and urban water quality changes. INFORMATIONAL NEEDS ON CHANGES IN RURAL WATERSHEDS AND THEIR RELATIONSHIPS TO PLANNING ACTIVITIES,
Texas Water Development Board, Austin; and International Boundary and Water Commission, El Paso, Texas.
Lewis B. Seward, and John J. Vandertulip.
In: Effects of Watershed Changes on Streamflow, Water Resources Symposium No 2, Austin, Texas, October 1968, p 37-43, University of Texas Press, Austin and London, 1969. 7 p, 1 fig.

Descriptors: *Data collections, *Water resources development, *Texas, *Planning, Hydrologic data, Investigations, Routing, Rainfall-runoff relationships, Urbanization, Water utilization, Water requirements, Water management (Applied).
Identifiers: *Texas Water Plan, *Data requirements.

Studies for the Texas Water Plan must include computations to determine runoff accurately, under all conceivable conditions. These studies of the future water resources will, in effect, reduce known and correlated runoff records to virgin con-

ditions, to which present and future watershed conditions and developments can be applied. Present depletions by man of the various river basins of the state must be evaluated. Accurate data will be necessary on domestic and industrial water use; on use of water by cropped lands, noncropped lands consuming irrigation water incidental to irrigation, transbasin or subbasin diversions, and reservoir loss - including evaporation loss and evapotranspiration on deltas and lake shores. These computations will entail the observation of cropped and noncropped areas, and their rates of use of irrigation water. Rates of consumptive use will have to be determined through transfer of experimental consumptive-use data to various sites of use within river basins through empirical relationships between experimental and climatological data. The depletions at sites of use must be computed and then routed downstream to determine channel losses resulting from man-made depletions. Inflow-outflow hydrologic studies must be conducted to analyze reaches of streams and rivers. (See W70-04723). (Knapp-USGS)
W70-04724

APPLICATION OF CONTINUOUS ACCOUNTING TECHNIQUES TO EVALUATE THE EFFECTS OF SMALL STRUCTURES ON MUKEWATER CREEK, TEXAS,
Texas Univ., Austin, and Texas Tech Univ., Lubbock.
Erdal Coskun, B. J. Claborn, and Walter L. Moore.
In: Effects of Watershed Changes on Streamflow, Water Resources Symposium No 2, Austin, Texas, October 1968, p 79-99, University of Texas Press, Austin and London, 1969. 21 p, 11 fig, 5 tab, 9 ref.

Descriptors: *Rainfall-runoff relationships, *Small watersheds, *Computer models, *Texas, Mathematical models, Simulation analysis, Hydrologic budget, Flood control, Reservoirs, Base flow, Hydrograph analysis, Water yield, Runoff, Infiltration, Evapotranspiration.
Identifiers: Mukewater Creek (Tex), Stanford Watershed Model.

The Mukewater Creek watershed in central Texas was selected to explore the application of Stanford Watershed Model IV to evaluate the effects of changes in the watershed on its output. The general approach was to determine parameters for the watershed model to fit watershed conditions during an early period, prior to changes in the watershed, and then use the model to estimate the watershed output that would have occurred later had the watershed remained in its original condition. Comparison of these estimated flows with the measured flows at later times is probably the best available measure of the effects of changes on watershed output. The digital model has been applied to the Mukewater Creek study area using the data of the three-year period, October 1955 to September 1958, prior to the construction of the floodwater-retarding structures for selection of the program parameters. For the 13 months of available record, channel losses attributable to the structures were positive for 9 months, amounting to 506 acre-feet or 7% of the flow during those months. During the other 4 months the losses with the structures were less, amounting to a total of 404 acre-feet or 17% of the flow during those months. Based on the limited data it would appear that the additional losses due to increased evapotranspiration resulting from prolonged flow in the channels were approximately balanced by the reduced losses due to less flood-bank infiltration. (See W70-04723). (Knapp-USGS)
W70-04726

URBAN EFFECTS ON QUALITY OF STREAMFLOW,
Texas Univ., Austin. Environmental Health Engineering Research Lab.
E. Gus Fruh.
In: Effects of Watershed Changes on Streamflow, Water Resources Symposium No 2, Austin, Texas, October 1968, p 255-282, University of Texas Press, Austin and London, 1969. 28 p, 22 fig, 5 tab, 15 ref. NSF Grant GU-1963, and Texas Water Quality Bd Contract No. 68-69-281.

Descriptors: *Reservoirs, *Urbanization, *Water quality, *Stratification, *Texas, Water pollution sources, Water pollution effects, Dissolved oxygen, Aquatic bacteria, Algae.
Identifiers: Austin (Tex), Colorado River (Tex).

The effects of impoundments and urbanization on the water quality of the Colorado River of Texas were studied in the reservoirs near Austin, Texas. Lake Travis, upstream from Austin, is large and deep and has no significant input of pollution. Lake Austin, the next reservoir downstream, is much smaller and shallower, and receives some recreational and urban runoff pollution. Town Lake, in Austin, is small and narrow with predominantly river characteristics, and receives some urban runoff pollution. Oxygen concentration-water depth data for the 3 reservoirs are tabulated. In Lake Travis, even in the winter, the temperature varied with depth. During the summer, the oxygen first became depleted at the thermocline region. Throughout the fall, various depths of Lake Travis became reaerated, but oxygen-depleted waters were still passing through the penstocks in November. In winter, oxygen was present at all depths. In Lake Austin, the summer oxygen concentration in the epilimnion varied around saturation. Dissolved oxygen decreased steadily in the hypolimnion during the summer and was consistently lower above the sediments. After autumn turnover, oxygen remained uniform from top to bottom. High numbers of total and coliform bacteria were found in Lake Austin during the spring following periods of intensive rainfall. The urban stream, Barton Creek, had significantly higher concentrations of solutes, nutrients, and bacteria than Town Lake above the stream's entrance, particularly during the spring rainfall period. All of Austin's urban streams enter Town Lake and Lake Austin, with the streams from the more highly developed areas entering Town Lake. (See W70-04723). (Knapp-USGS)

URBAN SPRAWL AND FLOODING IN SOUTHERN CALIFORNIA,
Geological Survey, Washington, D.C.
S. E. Rantz.
USGS Circular No. 601-B, Washington: 1970, 11 p, 1 fig, 1 map, 5 photo, 3 tab.

Descriptors: *Urbanization, *Flooding, *Flood control, Storm runoff, Land use, Zoning, Mudflows, Debris avalanches, Landslide.
Identifiers: *Urban sprawl.

The floods of January 1969 in south-coastal California provide a timely example of the effect of urban sprawl on flood damage. Despite record breaking, or near record breaking, stream discharges, damage was minimal in the older developed areas that are protected against inundation and debris damage by carefully planned flood-control facilities, including debris basins and flood-conveyance channels. By contrast, heavy damage occurred in areas of more recent urban sprawl where the hazards of inundation and debris or landslide damage have not been taken into consideration, and where the improvement and development of drainage or flood control facilities have not kept pace with expanding urbanization. (Davis-Chicago)

THE REGIONAL INTEREST IN WATERSHED MANAGEMENT,
Western States Water Council.
Jay R. Bingham.
In Arizona Watershed Symposium, 13th, Phoenix, Arizona, September 24, 1969, Proceedings, p 29-32.

Descriptors: *Water resources development, *Watershed management, *Water transfer, *Planning, *Coordination, Water law, Interstate compacts, Regional analysis, State governments, Federal government, Federal-state water rights conflicts, Public lands.
Identifiers: *Western States Water Council, Pacific Southwest Inter-Agency Committee, Pacific Northwest River Basins Commission, Public Land Law Review Commission.

The Western States Water Council was created in 1965 to effect cooperation among the western states in the development of water resources. The council has worked to establish principles, standards, and guidelines for developing regional water programs and has completed a review of large-scale water transfer proposals. The council has also brought together the heads of the Pacific Southwest Inter-Agency Committee and the Pacific Northwest River Basins Commission in an effort to coordinate the work of these two groups. The work of the Public Land Law Review Commission is of great importance to the council and it attempts to make the Commission aware of the needs of the western states. Information gained through watershed management programs is useful to all of these council activities. (Carr-Arizona)

4D. Watershed Protection

FIELD EXPERIMENT ON WASHITA RIVER,
Agricultural Research Service, Chickasha, Okla. Southern Plains Branch.
Monroe A. Hartman, Arlin D. Nicks, Edd D. Rhoades, Russell R. Schoof, and Paul B. Allen.
In: Effects of Watershed Changes on Streamflow, Water Resources Symposium No 2, Austin, Texas, October 1968, p 136-149, University of Texas Press, Austin and London, 1969. 14 p, 10 fig, 5 tab.

Descriptors: *Rainfall-runoff relationships, *Small watersheds, *Flood control, Dams, Reservoirs, Rain gages, Stream gages, Water yield, Runoff, Evaluation, Networks, Rainfall, Hydrograph analysis, Sediment transport, Sediment yield.
Identifiers: Southern Plains Watershed Research Center.

Initial analysis of hydrologic data from the Southern Plains Watershed Research Center, Chickasha, Oklahoma, shows that significant reductions can be expected in runoff peaks and sediment loads from watersheds treated with flood-detention dams. This has been shown with peak flow reductions of 16,400 to 8,300 cfs, 1,370 to 400 cfs, and 1,300 to 950 cfs, for three Sugar Creek storms. Sediment yield reductions with treatment were recorded on Winter Creek, where yields after treatment were only one-tenth as large as those before treatment. The effect of cover on runoff and sediment yields was measured on small watersheds. Small watersheds with poor cover had three times as much runoff and 25 times as much sediment yield as watersheds with good cover. Large flow losses from large out-of-bank flows have been recorded on the Washita River. Large flow losses have also been recorded in the physiography of a natural watershed such as Tonkawa Creek. The dense network of rain gages has shown the necessary rain-gage spacing for 95% accuracy on large and small watersheds. Data analysis currently in progress should add to the scope and reliability of the above findings. (See W70-04723). (Knapp-USGS)

LAND TREATMENT IN AGRICULTURAL WATERSHED HYDROLOGY RESEARCH,
Agricultural Research Service, Beltsville, Md. Soil and Water Conservation Research Div.
L. M. Glymph, and H. N. Holtan.

In: Effects of Watershed Changes on Streamflow, Water Resources Symposium No 2, Austin, Texas, October 1968, p 44-68, University of Texas Press, Austin and London, 1969. 25 p, 17 fig, 5 tab, 22 ref.

Descriptors: *Rainfall-runoff relationships, *Agricultural watersheds, *Demonstration watersheds, Mathematical models, Model studies, Management, Evapotranspiration, Watershed management, Water utilization.
Identifiers: Watershed models.

Studies of the hydrology of farm watersheds are reviewed with emphasis on relationships between land treatment and runoff coefficients. The rate of runoff depends on the size and shape of the watershed, surface slopes, nature and amount of vegetation, soil permeability, initial soil saturation, arrangements and character of drainage channels, evaporation, storage and underground conditions, and the duration and intensity of rainfall. Experimental watershed research seeks to establish principles and describe them in numerical terms so that by knowing the geology, soils, topography, and characteristics of the stream channel system of an ungaged watershed, its performance may be predicted under various land use patterns and treatments when subject to an assumed single precipitation event or to a series of such events. A mathematical model for computing the components of watershed hydrology in their natural chronological and spatial sequences of occurrence is under study by the USDA Hydrograph Laboratory. (See W70-04723). (Knapp-USGS)

TRACE METALS IN WATERS OF THE UNITED STATES, OCTOBER 1, 1962-SEPTEMBER 30, 1967,
Federal Water Pollution Control Administration, Cincinnati, Ohio. Div. of Pollution Surveillance.
John F. Kopp, and Robert C. Kroner.
Requests for report should be sent to Dept of Interior, FWPCA, Div of Pollution Surveillance, 1014 Broadway, Cincinnati, Ohio 45202. Federal Water Pollution Control Administration, Division of Pollution Surveillance Report, 1969. 207 p, 2 fig, 12 tab, 12 ref, 16 append.

Descriptors: *Water quality, *Trace elements, *Data collections, United States, Public health, Water chemistry, Mineralogy, Hydrologic data, Water quality act, Water resources, Water supply, Surveys.
Identifiers: Trace metals.

Trace elements in waters of the United States were determined from the analysis of over 1,500 samples. The minimum, maximum and mean observed values are given along with the number of positive occurrences and the frequency of detection. These data show that boron, barium and strontium were found in solution in over 98% of all samples. Zinc, iron and copper were observed with a frequency of 74 to 76%. Manganese was observed slightly less regularly at a 51% frequency and aluminum, lead, chromium, molybdenum and nickel were detected in 16 to 33% of the samples. Cadmium, beryllium, silver, cobalt, vanadium and arsenic were detected at measurable levels in less than 7% of all samples. The total body of data approximates 30,000 determinations. Based on soluble trace metals, only 0.6% exceeded the limits set by the Water Quality Criteria for public water supplies. (Knapp-USGS)

Descriptors: Oil, *Sampling, Absorption, Separation, Analytical techniques.
Identifiers: *Oil sampling, Oil spillage, Oil slicks.

Sampling of oil in the environment, depending upon the thickness of the slick, can present certain operational problems, most paramount of which is the collection of an adequate volume of sample required for identification by chemical analyses. Several basic 'dip-stick' techniques, which are primarily applicable for sampling slicks with a thickness of greater than 2 mm, as well as suggested methods for sampling thin oil slicks are discussed and illustrated. Included in this report are preliminary results on oil entrapment by solid absorbents obtained by the Oil and Hazardous Materials Research Section, Edison, New Jersey. Also reported are results of investigations performed by foreign and U.S. scientists, using various types of sampling equipment and materials.

OIL TAGGING SYSTEM STUDY, Summary.
Melpar, Falls Church, Va.

Available from the Clearinghouse as PB-190 193, $3.00 in paper copy, $0.65 in microfiche. Federal Water Pollution Control Research Series DAST-11, Oct, 1969. 31 p, 88 ref. FWPCA Project 15080 DJQ--10/69, Contract No. 14-12-500.

Descriptors: Marking techniques, Tracing techniques, *Tagging, Oil, Oil wastes.
Identifiers: *Oil tagging, *Surveillance, Enforcement, *Oil pollution.

Several methods of identifying the source of oil pollution are critically examined. These methods are grouped into two categories: passive tagging and active tagging. Passive tagging assumes that oils are so chemically diverse that their contents consititute a stable chemical fingerprint that can be unequivocally disclosed in the laboratory. Active tagging requires that an inexpensive, coded material be added to oil; this material must be chemically and physically stable in both oil and oil slicks; it must also be readily identifiable by available analytical techniques; and it must have no adverse effect on the oil's subsequent use. Three methods of passive tagging (trace metals, sulfur-isotope ratios, and paper chromatography) and three methods of active tagging (halogenated polycyclic aromatics, organometallics, and coded microspheroids) have been examined. Passive tags cannot be recommended because the passive tags are quite likely to mingle, to evaporate, to be dissolved, or to be oxidized; even if these processes do not occur, they can create formidable forensic problems for the prosecution and telling counter-arguments for the defense. Since active tags are designed to be stable and identifiable, they are satisfactory for the job; and the three types of active tags reviewed show promise and merit.

LEACHING OF POLLUTANTS FROM REFUSE BEDS,
Battelle Memorial Inst., Columbus, Ohio; and West Virginia Univ., Morgantown. Dept. of Civil Engineering.
Syed R. Qasim, and Jerry C. Burchinal.
ASCE Proceedings, Journal Sanitary Engineering Division, Vol 96, No SA1, Paper 7078, p 49-58, February 1970. 10 p, 5 fig, 6 tab, 7 ref, append. USPHS Grant EF-40 (RI).

Descriptors: *Landfills, *Leaching, *Water pollution sources, *Path of pollutants, Percolation, Garbage dumps, Seepage, Public health, Water analysis, Evaporation, Evapotranspiration.
Identifiers: Sanitary landfill leaching.

A procedure is presented for estimating theoretically the chemical quality of leachates from sanitary landfills. A theory of column chromatography was employed to determine the leaching of chloride during the movement of water through refuse beds. Generalized breakthrough curves were used to obtain the theoretical chloride concentrations. Families of curves were then derived from experimental results, representing the ratios of various leaching materials to the theoretical chloride concentrations. A comparison of experimental and theoretical results shows good agreement. The method can be applied to the field study of existing landfills to determine the chemical composition of polluting liquid during the leaching process, if the cumulative precipitation, evaporation, evapotranspiration, runoff coefficients, and the depth of refuse beds are known. (Knapp-USGS)

TREATMENT STUDIES OF COMBINED TEXTILE AND DOMESTIC WASTES,
Purdue Univ., Lafayette, Ind.
D. T. Lauria, and C. A. Willis.

Proceedings 19th Industrial Waste Conference, p.45-58, 1964. Engineering Extension Series 117.

Descriptors: *Waste water disposal, *Pilot plant, *Sewage treatment, *Waste water treatment, *Sludge disposal, *Data collections, *Treatment facilities, Domestic waste, Effluents, Water supply, Biological treatment, Biochemical Oxygen Demand, Screening equipment, Sludge treatment, Lagoons, Aeration, Sedimentation, Chlorination, Centrifugation, Waste waters.
Identifiers: Textile waste, Grit removal, Filters (Fluid).

At Valdese, N.C., more than 80 percent of the total waste flow consists of waste waters from the dyeing and finishing operations at textile mills. The existing sewage works are overloaded and, since the effluents are discharged to a creek flowing into a lake used for recreational and water-supply purposes, it was decided to carry out pilot-plant experiments to obtain data for the design of a new plant for biological treatment of combined domestic sewage and textile waste waters. Some results of operation of the pilot plant are summarized in tables and graphs. The method of treatment chosen was a low-loading completely-mixed process, and results showed that reductions in BOD of 90 percent could be obtained with BOD loadings of at least 2 lb. of BOD per lb. of sludge per day. The oxygen requirements of the process were estimated to determine the capacity of aeration equipment required. The proposed new plant, which will have a capacity of 3.2 m.g.d., will comprise facilities for screening and grit removal, lagoons with mechanical surface aerators, sedimentation tanks, facilities for chlorination of effluents, and a sold-bowl centrifuge for thickening excess sludge before disposal as landfill. (Livengood-Mattox North Carolina State Univ)
W70-04795

CHEMICAL NATURE OF EFFLUENTS FROM THE TEXTILE, LEATHER, AND PAPER INDUSTRIES,
M. Kehren.
Ciba Review, No 1212, p 8-12, 1957.

Descriptors: *Biochemical oxidation demand, Color, Turbidity.
Identifiers: *Permanganate value, *Textile mill wastes, Dyes.

The two most common tests for all types of water are the permanganate value and biological oxygen demand. Textile effluents can contain floating matter, settleable suspended matter, colloidal impurities, polluting substances in true solution and dyes. Textile effluents show a high degree of pollution, as evidenced by their colour, turbidity, and high permanganate value. Most effluents have high dissolved or suspended mineral and organic values, and most textile wastes are alkaline. A chart on the properties of textile wastes is included. (Robinson-North Carolina State Univ)

5B. Sources of Pollution

BIODEGRADATION OF DODECYLGUANIDINE ACETATE (DODINE),
Geological Survey, Denver, Colo.
Marvin C. Goldberg, and Robert L. Wershaw.
Available for sale from Superintendent of Documents U S Government Printing Office, Washington, D C, 20402-Price $3.75. Geological Survey Research 1969, Professional Paper 650-D, p D235-D239, 1969. 5 p, 3 fig, 1 tab, 16 ref.

Descriptors: *Pesticides, *Biodegradation, *Fungicides, *Bottom sediments, Aquatic microorganisms, Mud, Colorado, Aquatic microbiology.
Identifiers: Dodine, Denver (Colo).

A two-part investigation of the biodegradation of dodecylguanidine acetate (dodine), a fungicide, showed that two soil organisms, a Flavobacterium sp. and an Achromobacter sp., utilize the material as the sole source of carbon. By use of C-14-labeled fungicide, the investigation also showed that the biological content of river muds typical of the Denver, Colo., area degrades up to 5% of a dodine charge within 68 days. Preconditioning the river muds to the fungicide neither enhanced or decreased the amount of biodegradation in any of the samples tested. (Knapp-USGS)

STATEMENT OF CONCERN,
Johns Hopkins Univ., Baltimore, Md. School of Hygiene and Public Health.
E. P. Radford, I. Merz, C. Ray, R. M. Herriott, and C. W. Kruse.
Environment, Vol 11, No 7, p 18-27, September 1969. 10 p, 3 fig, 3 photo, 1 tab, 7 ref.

Descriptors: *Thermal pollution, *Radioactive wastes, *Water pollution sources, *Water pollution effects, *Estuaries, Maryland, Nuclear powerplants, Currents (Water), Dispersion, Waste dilution, Ecology, Environment.
Identifiers: Chesapeake Bay, Calvert Cliffs (Md).

The proposed Calvert Cliffs nuclear powerplant will add heat and radioactive material to Chesapeake Bay. Research on possible effects is recommended before construction is authorized. The proposed plant site is on 1135 acres of a sparsely populated section of Calvert County, Maryland, on the shore of Chesapeake Bay. The land is partially forested, and there is farming, raising of beef cattle, and residential use of some areas. Adjacent waters are used for commercial and sport fishing and water sports. The adjacent Bay is six miles wide and a maximum of 110 feet deep, and tidal flows are of greater velocity than elsewhere. It is estimated that a plume of heated water will extend outward from the plant no farther than 2000 feet. This estimate is evidently based upon modeling studies which have not been completed. The judgment to proceed with construction of such large nuclear powerplants is questioned because many environmental and public health hazards have not been satisfactorily investigated or resolved. There is no question that operation of this and other contemplated plants will alter the Bay ecology--the question is how much and in what manner and what the effect will be upon the health and safety of the public. (Knapp-USGS)

EARTH, AIR, WATER,
Southern Illinois Univ., Carbondale. Dept. of Biology.
Justin Frost.
Environment, Vol 11, No 6, p 14-33, July-August 1969. 20 p, 3 fig, 6 tab, 38 ref.

Descriptors: *Pesticide drift, *Water pollution sources, *Path of pollutants, *Persistence, *Antarctic, Fallout, Winds, Atmospheric physics, Air circulation, Air pollution, Precipitation (Atmospheric).
Identifiers: Pesticide distribution (Geographic).

The discovery of pesticides in Antarctic wildlife has provided a dramatic example of the spread of pesticides. The continent, with its ice shelf, lies over 600 miles from the tip of South America, over 1,000 miles from New Zealand, and over 2,000 miles from the tip of South Africa. Yet despite this isolation, insecticides have been detected in seals, in fish, and in penguins and other birds. Since all the tested animals, with the exception of the skua, feed exclusively in Antarctic waters, the presence of pesticide residues in these animals clearly shows that pesticides have been carried into the Antarctic environment in significant amounts from far distant points of origin. Rain falling on the agriculturally remote Shetland Islands has been found to have about the same level of pesticide concentrations as is found in the San Joaquin River although that river receives drainage directly from irrigated fields. One source of contamination of the atmosphere is pesticide-laden dust picked up directly from soils by storms. The principal mechanism by which the atmosphere cleans itself is rainfall, so that the water-insoluble nature of these pesticides means that they will be removed relatively slowly, permitting their accumulation and world-wide dispersal (Knapp-USGS)

H. L. Volchok, M. Feiner, H. J. Simpson, W. S. Broecker, and V. E. Noshkin.
Journal of Geophysical Research, Vol 75, No 6, p 1084-1091, February 20, 1970. 8 p, 2 fig, 4 tab, 31 ref.

Descriptors: *Fallout, *Oregon, *Strontium radioisotopes, Surveys, Sampling, Lakes, Cores, Data collections, Oceans, Pollutants, Precipitation (Atmospheric), Radiochemical analysis, Radioisotopes.
Identifiers: Crater Lake (Oregon), Oceanic fallout.

By the analysis of water and sediment cores, the total inventory of strontium 90 in Crater Lake, Oregon, was determined to be 4.2 curies. In terms of surface fallout, this is equivalent to about 70 mc/sq km. The comparable fallout on the surrounding land area, determined from analyses of soil sections was 58 mc/sq km, and a value predicted by extrapolation from other Oregon stations was 73 mc/sq km. Hence, no substantial difference in the efficiency of fallout collection could be attributed to the mere presence of the large water surface. (Knapp-USGS)

A PRELIMINARY REPORT ON THE CHARACTERISTICS OF A HEATED JET DISCHARGED HORIZONTALLY INTO A TRANSVERSE CURRENT, PART 1 - CONSTANT DEPTH,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
H. H. Carter.
Chesapeake Bay Institute Technical Report 61, Reference 69-14, Johns Hopkins University, November 1969. 36 p, 18 fig, 14 ref, append. USAEC Contract AT (30-1)-3109.

Descriptors: *Estuaries, *Thermal pollution, *Mixing, Thermal powerplants, Jets, Hydraulic models, Model studies, Hydraulic similitude, Heated water, Dispersion, Diffusion, Path of pollutants, Water temperature, Hydraulics, Hydrodynamics.
Identifiers: Thermal discharges, Jet discharges.

The behavior of a heated discharge of water jetted at right angles into a moving stream of water was studied using a hydraulic model. The discharge orifice is rectangular to simulate a discharge canal and both the jet stream and receiving waters are confined vertically between a free surface (the sea surface), and a solid level boundary (the sea bottom). Experiments were performed in the circulating water flume in the Hydraulics Laboratory at the Chesapeake Bay Institute. The flume has a free surface test section 3 feet wide, 3 ft. 9 in. deep (3 foot water depth) and 16 feet long. The system is capable of producing water velocities of up to 3.2 feet per sec in the test section. For the heated discharge, a model thermal plant was constructed which consisted of a pump, a flow control system, a rotometer, electric immersion heaters to simulate the condensers, and a temperature sensing and control system to maintain a constant temperature rise between intake and discharge. HERBICIDAL PROPERTIES OF SUBSTITUTED INDANS,
Ontario Dept. of Agriculture and Food, Guelph. Provincial Pesticide Residue Testing Lab.
Richard Frank.
Canadian Journal of Plant Science, Vol 49, p 209-215, 1969. 1 fig, 5 tab, 7 ref.

Descriptors: *Herbicides, *Grasses, *Preemergents, *Weeds, Phytotoxicity, Potatoes.
Identifiers: *Indans, Sugar beets, Broadleaved weeds, Preplant treatment, Crabgrass, Greenhouse studies, Growth chamber studies, Field studies.

An appraisal of herbicidal properties of indanyl ethyl ketones was conducted by field, greenhouse, and growth chamber trials. Grasses exhibited varying degrees of susceptibility, but broadleaved weeds proved to be resistant to compounds. Lower temperatures increased phytotoxicity to sugar beets. Preplant and incorporation treatments reduced beet stands more than preemergence treatments. The desired rates of application varied from 1.7 to 3.4 kilogram/hectare. (Wilde-Wisconsin)

YIELDS AND SOURCES OF NITROGEN FROM SEVERAL LAKE ONTARIO WATERSHEDS,
Ontario Water Resources Commission, Toronto. Div. of Labs.
J. H. Neil, M. G. Johnson, and G. E. Owen.
Proceedings, Tenth Conference on Great Lakes Research, University of Michigan, Great Lakes Res Div Publication No 15, p 375-381, 1967. 3 fig, 2 tab, 5 ref.

Descriptors: *Watersheds (Basins), *Lake Ontario, *Nitrogen, Phosphorus, Great Lakes, Land use, Sewage effluents, Surface runoff, Regression analysis, Cyanophyta, Water pollution sources, Eutrophication, Phosphates, Nutrients, Lakes.
Identifiers: *Nutrient sources, *Nutrient yields, Urban watersheds, Rural watersheds, Gross yield, Nitrogen rating curve, Nutrient removal, Seasonal variation, Toronto (Ontario), West Humber River (Ont), German Mills Creek (Ont), Little Rouge River (Ont), Stouffville Creek (Ont), Altona Creek (Ont), Highland Creek (Ont).

The nitrogen yield was estimated from six southern Ontario watersheds, representing rural and urban land uses, on the basis of curves for total nitrogen discharge applied to the hydrograph of each watershed. Mean total annual yield of nitrogen (in pounds/square mile per year) was approximately 3,200 for rural streams, and 34,000 for urban watersheds (includes effluents from a secondary treatment plant). Nitrogen (N) yields for February, March, and April, constituted 58-69% of the annual contribution in rural watersheds, while yields from urban watersheds showed little variation and were greater than spring maxima of rural streams throughout the year. Yields calculated from phosphorus (P) concentration in the same samples indicated a nitrogen to phosphorus ratio of 1.5 in urban watersheds and 8.0 for rural watersheds. Under present conditions of sewage treatment in one urban watershed, 28% of P and 22% of N are removed. Complete removal of both nutrients from the sewage would result in 85% reduction of gross yield of phosphate (25% presently being achieved) and 87% reduction in gross yield of nitrogen (20% presently achieved). (Ketelle-Wisconsin)

NOTES ON ESTUARINE POLLUTION WITH EMPHASIS ON THE LOUISANA GULF COAST,
Public Health Service, Cincinatti, Ohio. Div. of Water Supply and Pollution Control.
K. E. Biglane.
Estuaries, Publication No 83, American Association for the Advancement of Science, Wash, D C, p 690-692, 1967. 3 p, 5 ref.

Descriptors: *Water pollution, *Estuaries, *Pesticides, *Louisiana, Fishkill, Watersheds (Basins), Rivers, Dieldrin, Endrin, Chlorinated hydrocarbon pesticides, Coastal marshes, Water quality, Fisheries, Dredging, Navigation, Industrial wastes, Domestic wastes.
Identifiers: *Estuarine pollution, Lower Mississippi Basin, Atchafalaya River.

Toxic synthetic organic chemicals in water appear to be the cause of continuing fishkills in the lower Mississippi drainage basin. Lethal concentrations of endrin, dieldrin and two unidentified chlorinated hydrocarbons were found in dead or dying fish from the Mississippi and Atchafalaya Rivers. Other cases of fishkills due to pollution of the Louisiana Gulf Coast are cited. Louisiana has 422,000 acres of coastal marshes and estuaries which are very productive as fishery, fur, and recreational areas. Oil and other mineral production, shell dredging, industrial and water quality and the physical character of these areas. The preservation of estuarial land masses is important and every effort should be directed toward this goal. (Carstea-USGS).

LAKE EUTROPHICATION -- A NATURAL PROCESS,
Geological Survey, Albany, N.Y.
Phillip E. Greeson.
Water Resources Bulletin, Vol 5, No 4, p 16-30, December 1969. 15 p, 6 fig, 2 tab, 44 ref.

Descriptors: *Eutrophication, *Lakes, Nutrients, Water pollution effects, Productivity, Sediments, Urbanization, Water pollution treatment, Algae, Water management (Applied), Limnology.
Identifiers: Eutrophication treatment.

Lake eutrophication is an economic, recreational, and aesthetic problem that affects every lake of the world. Eutrophication is the natural process of lake aging, and progresses irrespective of man's activities. Pollution, however, can hasten the natural rate of aging and shorten the life expectancy of a body of water. The eutrophication of a lake consists of the gradual progression from one life stage to another based on the degree of nourishment or productivity. The extinction of a lake is attributed

to enrichment by nutritive materials, biological productivity, decay, and sedimentation. Presently used methods for retarding eutrophication are the abatement of cultural enrichment, treatment of eutrophic symptoms, and control of fundamental causes. (Knapp-USGS)

DISTINCTION BETWEEN BACTERIAL AND ALGAL UTILIZATION OF SOLUBLE SUBSTANCES IN THE SEA,
Marine Lab., Aberdeen (Scotland); and Indiana Univ., Indianapolis. Dept. of Microbiology.
A. L. S. Munro, and T. D. Brock.
Journal General Microbiology, Vol 51, p 35-42, 1968. 3 fig, 1 tab, 14 ref, 3 plates.

Descriptors: *Aquatic bacteria, *Algae, *Analytical techniques, *Marine microorganisms, Physiological ecology, Organic matter, Water pollution effects, Diatoms, Carbon radioisotopes, Kinetics, Tritium, Chlorophyll.
Identifiers: *Heterotrophy, *Organic solutes, *Marine environments, Microbial ecology, Fluorescence microscopy, Acetate, Carbon-14, Autoradiography, Michaelis-Menten equation, Loch Ewe (Scotland), Scotland, Phaeopigments, Acridine orange, Lineweaver-Burke equation.

Staining with acridine orange and direct observation with fluorescence microscopy demonstrates numerous viable bacteria and diatoms attached to sand grains of a littoral beach to depths exceeding 10 centimeters. Kinetic analysis of uptake of radiocarbon-labelled acetate over range, 10-5000 micrograms/liter, demonstrates two uptake mechanisms: one, saturable at lower concentrations (Michaelis-Menten kinetics), and another, describable as diffusion, the latter having been attributed by others to algal uptake. Autoradiography, however, reveals that bacteria alone are responsible for uptake of tritiated acetate. In those situations where Michaelis-Menten kinetics applied, maximum attainable uptake rates (V) were much greater than any previously reported for water, such values for V being attributable to larger microbial populations in sand. Since reasons for existence of two types of kinetics are obscure, it is dangerous to make conclusions regarding microbial heterotrophy based on kinetic analysis alone. Based on these studies, it seems clear that algal heterotrophy is negligible in sea waters, and that autoradiography is an effective tool in studies of energetics and trophic relationships in microbial ecology. VERTICAL DISTRIBUTION OF ZOOPLANKTON IN RELATION TO THE EASTERN PACIFIC OXYGEN MINIMUM,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
Alan R. Longhurst.
Deep-Sea Research, Vol 14, p 51-63, 1967. 3 fig, 3 tab, 22 ref

Descriptors: *Zooplankton, *Vertical migration, *Sampling, Biomass, Anaerobic conditions, Coasts, Diatoms.
Identifiers: *Vertical distribution, *Plankton sampler, Nocturnal migration, Coastal upwelling, California Current, Baja California, Calanus helgolandicus.

The use of a new plankton sampler assisted to evaluate the presence of a dense population of Calanus helgolandicus and other plankters below 150 meters in the southern part of the California Current in oxygen-deficient water (0.2 milligrams/liter of oxygen). Several species of this deoxygenated zone perform nocturnal migrations to upper strata with oxygen tension up to 5.0 milligrams/liter. The unusual abundance of the fauna in the deoxygenated layer is attributed to the effects of the local coastal upwelling followed by rapid diatom blooms along the coast of California peninsula. (Wilde-Wisconsin)

SEASONAL AND VERTICAL DISTRIBUTION OF THE ZOOPLANKTON IN THE ASKO AREA (NORTHERN BALTIC PROPER) IN RELATION TO HYDROGRAPHICAL CONDITIONS,
Stockholm Univ. (Sweden). Dept. of Zoology; and Stockholm Univ. (Sweden). Asko Lab.
Hans Ackefors.
Oikos, Vol 20, No 2, p 480-492, 1969. 13 fig, 14 ref.

Descriptors: *Zooplankton, *Seasonal, Temperature, Light, Salinity, Vertical migration.
Identifiers: Vertical distribution, Asko area (Baltic Sea), Synchaeta, Podon polyphemoides, Acartia bifilosa, Eurytemora.

Sampling of zooplankton in intervals of 2.5 meters to 36 meters depth revealed seasonal and vertical distribution of rotifers, cladocerans, copepods, and other plankters. The maximum density of organisms of 650 specimens per 23 liters was observed from the end of July to the middle of September. Synchaeta spp attained the greatest density from July until part of September, whereas Podon polyphemoides was largely confined to 15 meters depth in July and August. Acartia bifilosa was present at all depths to 35 meters and was especially abundant in September, December, and March. Eurytemora spp were evenly distributed from bottom to the surface and attained maximum density in summer and fall. Salinity varied from 0.62 to 0.70% at the surface, and from 0.67 to 0.78% at the bottom. (Wilde-Wisconsin)

TO PREVENT AN UNNATURAL DEATH.
Open Lands Project, Chicago, Ill.

Summary of Proceedings of Four-State Lake Michigan Conference, Chicago, Illinois, April 1969. 30 p.

Descriptors: *Lake Michigan, Illinois, Indiana, Wisconsin, Michigan, Thermal pollution, Industrial wastes, Sewage treatment, Landfills, Chemical wastes.

The threats to Lake Michigan are seen as (1) thermal pollution; (2) sewage and industrial wastes; (3) agricultural chemicals; (4) landfill; and (5) unplanned shoreline development. Statements from various advocacy groups from the four states participating give indication of strong citizen concern about the deterioration of Lake Michigan waters. All participants agreed upon viewing Lake Michigan in a holistic manner so as to consider all the implications of the intra and inter-relationships peculiar to the lake. Recommendations from the Conference included a proposal that a major effort be directed to total planning for the lake in order to detect quickly ecological imbalances which occur so that they can be remedied before they become irreversible. (Starr-Chicago)

PLANKTON DIATOM ASSEMBLANCES IN LAKE MICHIGAN,
Michigan Univ., Ann Arbor.
Eugene F. Stoermer, and J. J. Yang.
University of Michigan, Ann Arbor, Great Lakes Research Division, Special Report No. 47, 1969. 268 p, 65 ref.

Descriptors: Phytoplankton, *Diatoms, Lake Michigan, Eutrophication.
Identifiers: Diversity index, *Thermal bar.

Detailed analyses are presented of plankton diatom populations occurring in modern collections from all parts of the lake as well as collections from the Chicago area dating back to 1876. Records of occurrence and population frequency are given for 714 taxonomic entities. Diversity and redundancy indices were calculated for the assemblages examined. Study showed increasing incursion of pollution tolerant forms into the Lake Michigan flora. Species which have caused objectional blooms in recent years in southern Lake Michigan first occurred in collections taken in the 1930's and now are found in all parts of the lake. Species associated with extreme water quality degradation in Lake Erie have recently been introduced into Lake Michigan. At the present time extreme differences are noted between the nearshore flora and that of the open lake, particularly during thermal bar conditions in the spring. On the basis of floristic analysis the author's general conclusion is that Lake Michigan at the present time is approaching the break-point between transient algal nusiances confined to the inshore area and more drastic changes affecting the entire ecosystem.

5D. Waste Treatment Processes

PHOTOLYSIS MECHANISMS FOR POLLUTION ABATEMENT,
IIT Research Inst., Chicago.
Layton C. Kinney, and Victor R. Ivanuski.
Available from the Clearinghouse as PB-190 169, $3.00 in paper copy, $0.65 in microfiche. Robert A. Taft Water Research Center Report No TWRC-13, Federal Water Pollution Control Administration, October 1969. 46 p, 13 fig, 11 tab, 10 ref, 1 append. FWPCA Project 17050---10/69, Contract No 14-12-433.

Descriptors: *Pollution abatement, *Water pollution control, *Sewage, Industrial wastes, Domestic wastes, Organic matter, Irradiation, Titanium, Sands, Streams, Lakes.
Identifiers: *Photolysis, *Photocatalysts, Photocatalytic oxidation.

Photocatalytic oxidation of dissolved organic matter by irradiation of slurries of zinc titanate, zinc oxide, titanium dioxide, and beach sand was studied using sunlamps. The reaction appears to follow first order kinetics in most cases. Zinc oxide

appears to be a superior catalyst for this purpose. Photocatalysts are widely distributed in nature, and photolytic oxidation is a mechanism whereby dissolved organic matter is oxidized in the natural environments of streams and lakes. Photolytic oxidation reduced the dissolved organic matter in a sample of domestic sewage by 50% and 75% during 24 hours and 70 hours, respectively. The limiting factor appears to be the activity of the photocatalyst. The most promising area of photolysis application will be in problems of industrial disposal where the concentrations of organic matter are high. (Carstea-USGS)

MATHEMATICAL MODEL OF TERTIARY TREATMENT BY LIME ADDITION,
General American Transportation Corp., Niles, Ill.
General American Research Div.
L. Seiden, and K. Patel.
Available from the Clearinghouse as PB-190 170, $3.00 in paper copy, $0.65 in microfiche. Robert A. Taft Water Research Center Report No TWRC-14, Federal Water Pollution Control Administration, September 1969. 69 p, 10 fig, 5 tab, 152 ref, 3 append. FWPCA Project 17010---9/69, Contract No 14-12-416.

Descriptors: *Mathematical models, *Tertiary treatment, *Lime, *Phosphorus compounds, *Computer programs, Effluents, Acidity, Cost analysis, Streams, Streamflow, Flow rates, Coagulation.
Identifiers: Secondary effluents, *Phosphorus removal.

The status of phosphorus removal from secondary effluents by lime addition is presented. Based on the empirical information available, a mathematical model of the process was developed. The factor which best correlated with phosphorus removal was the pH of the tertiary effluent. Cost information for the model was generated based on a solids-contact type precipitator such as the Infilco Densator. A computer program, in FORTRAN IV, derived from the model, was developed for use as a subroutine in the FWPCA Executive Calling Program. Given the input stream flow rate and analyses, and the final pH, the program computes the necessary doses of lime and coagulant, their costs, the size and cost of the equipment, the degree of phosphorus removal, and the output stream analyses. (Carstea-USGS)
W70-04547

APPRAISAL OF GRANULAR CARBON CONTACTING: PHASE 1. EVALUATION OF THE LITERATURE, AND PHASE 2. ECONOMIC EFFECT OF DESIGN VARIABLES,
Swindell-Dressler Co., Pittsburgh, Pa.
A. E. Cover, and L. J. Pieroni.
Available from the Clearinghouse as PB-190 168, $3.00 in paper copy, $0.65 in microfiche. Robert A. Taft Water Research Center Report No TWRC-11, Federal Water Pollution Control Administration, May 1969. 109 p, 33 fig, 21 tab, 58 ref. FWPCA Project 17020---5/69, Contract No 14-12-105.

Descriptors: *Reviews, *Waste water treatment, *Activated carbon, Tertiary treatment, Organic matter, Wastes, Chemical oxygen demand, Particle size, Economics, Costs, Flow, Adsorption, Bibliographies, Surveys.
Identifiers: Granular carbon filters.

A literature review of tertiary waste water treatment gives special attention to activated carbon adsorption of chemical oxygen demand (COD), allowable capacity (loading) of carbon with organic waste matter, carbon particle size, and number of regeneration cycles on adsorption capacity and rate. The economic effects of shop fabrication and field erection of vessels, surge designs, plant size, idle carbon inventory, velocity, contact time, particle size, regeneration loss, carbon capacity, material costs, number of contacting stages, and in-place regeneration are discussed. Most of the data were collected from carbon treatment plants at Pomona (California), Lake Tahoe (California), Nitro (West Virginia), Washington (New Jersey), and Lebanon (Ohio). Recommendations are made for further evaluation and experimental work. (Carstea-USGS)
W70-04548

APPRAISAL OF GRANULAR CARBON CONTACTING: PHASE 3. ENGINEERING DESIGN,
Swindell-Dressler Co., Pittsburgh, Pa.
A. E. Cover, and C. D. Wood.
Available from the Clearinghouse as PB-190 167, $3.00 in paper copy, $0.65 in microfiche. Robert A. Taft Water Research Center Report No TWRC-12, Federal Water Pollution Control Administration, May 1969. 40 p, 4 fig, 1 tab, 5 ref, 3 append. FWPCA Project 17020---5/69, Contract No 14-12-105.

Descriptors: *Cost analysis, *Activated carbon, *Tertiary treatment, *Design criteria, Waste water treatment, Economics, Engineering structures, Equipment.
Identifiers: *Granular carbon.

The engineering design and cost estimate of a 10 million-gallon-per-day plant for tertiary treatment of waste water with granular activated carbon contains the process description, design bases, plant operation, control rationale, equipment list, equipment specifications and cost estimate. This design incorporates reliability, economy and current state-of-the-art technology. Although not fully proven in practice, it is based upon the application of mature engineering judgement to available data and offers economies over any other plant which has been successfully demonstrated. CHARACTERISTICS OF WOOL DYEING WASTES AND EXPERIMENTAL TREATMENT,
J. A. McCarthy.
Sanitalk, Vol. 1, p 8-11, 1952.

Descriptors: *Test procedures, *Trickling filters, *Waste water treatment, Coagulation, Sedimentation, Lagoons, Biochemical oxygen demand.
Identifiers: *Wool dyeing wastes, *Color removal, Dyeing wastes, Vat dyeing waste, Filter loading, Top dyeing waste.

This report studied the use of experimental trickling filters for treating the two types of wool dyeing wastes. The top dyeing waste contains little suspended matter and much of the BOD is in solution. Ordinary coagulates are generally ineffective and even prolonged sedimentation gives little improvement. Storage in lagoons may result in some reduction in color, but little reduction in BOD. With standard trickling filters it was found that loadings of 1000 to 1500 pounds of BOD per acre foot resulted in a BOD reduction of 90%. Recirculating the wastes through the filters with a ratio of 5 to 1 showed that BOD loading could be gradually increased to 5000 lbs./acres ft. with an 89% reduction in BOD. Vat dyeing wastes while lower in BOD, required a reduction in filter loading to 1000 lbs. of BOD per acre foot in order to obtain a 90% reduction. Recirculation of this waste through the filters increased the loading only 30 to 40 percent. As both types of dye wastes are customarily found in the same mill combing these two wastes gave satisfactory effluent through trickling filters with loadings of 1200 lbs. of BOD per acre foot. RIVER POLLUTION IN INDUSTRIAL AREAS: AN INSOLUABLE PROBLEM,
L. Klein.
Institute of Sewage Purification Journal and Proceedings, p 503 511, 1961. 16 ref.
Identifiers: *Turbine aeration.

Special difficulties facing river boards in highly industrial areas of England, Wales, and Scotland are: (1) multiple pollution in small river, (2) inadequate dilution water, (3) intractable nature of certain trade effluents, and (4) high cost of purifying sewage and trade effluents. Possible ways of improving rivers in these areas are (1) stricter standards for sewage effluents, (2) improved setting for sewer storm overflows, (3) discharge of trade effluents to sewers, (4) use of clean water to dilute effluents, (5) treatment of river water. Turbine aeration is a practical method of increasing the dissolved oxygen content of river water passing through hydroelectric installations. The Swedes increase dissolved oxygen content by bubbling compressed air into water through a perforated plastic tube. Perhaps the most satisfactory method of dealing with a grossly polluted river is a complete treatment plant containing settling equipment and an activated sludge process. (Robinson - North Carolina State University)

EFFECTS OF TRADE EFFLUENTS ON ACTIVATED SLUDGE TREATMENT AND OBSERVATIONS UPON RESIDUAL IMPURITIES IN EFFLUENTS,
Bolton and District Joint Sewage Board.
Peter Brown.
Institute of Sewage Purification Journal and Proceedings Part 3, p 267-271, 1963.

Descriptors: *Activated sludge, *Biochemical oxygen demand, Waste water treatment.
Identifiers: *Finishing wastes, Starch.

The investigation is confined to a laboratory scale-activated sludge process. If the waste contained very little else but starchy products, the permanganate value and BOD drop to the level of the control sample after a short period of further aeration. The experiment on trade effluent containing starchy material seems to indicate that a higher initial BOD loading was not necessarily the cause of extra residuals in the effluents. Certain trade effluents contribute residual impurities to a sewage works' final effluent. Under test conditions, residuals increase the permangate value of the effluent to a greater extent than the BOD. The presence of residuals should be a major consideration when deciding whether a trade effluent can be accepted for treatment at a sewage works. (Robinson - North Carolina State University)

TRADE EFFLUENT CONTROL IN THE CARPET INDUSTRY,
Trent River Board (Gt. Brit.).
D. Evers.
Textile Institute and Industry, Vol. 3, p237-240, 1966.

Descriptors: *Water pollution, *Biochemical Oxygen Demand.
Identifiers: *Wool scouring, *Carpets, Dyeing, Sizing, Latices, Moth-proofing, Mildew resistance treatments, Sulfuric acid, Caustic, Heat pollution, Wool grease, Wool.

The processes causing water pollution are (1) scouring of wool, (2) dyeing, (3) sizing the carpet backing, (4) latexing, and (5) moth and mildew proofing. Scouring of wool is by far the worst source of pollution, but this can be materially reduced by (1) acid cracking with sulfuric acid or (2) by the use of calcium chloride. Either allows much of the wool grease and other impurities to be removed as solids from the effluent water obtained from scouring. Four tables present numerical data. Dyehouse effluents may have pH values as low as 2 and require alkaline treatment, but they are also

very hot and may require cooling lest they cause overheating in the sewage disposal plant. The back sizing with starch or glue is a minor source of water pollution. Latexing effluents may be treated with acid to precipitate the latex and whiting. Moth and mildew proofing may result in acid which can be neutralized or fluorides, which if excessive, can be precipitated with a barium compound. It is concluded that effluents from carpet mills must be individually studied and each handled as a separate problem. (Work-North Carolina State Univ)

TREATMENT OF WOOL WASTES,
Purdue Univ., Lafayette, Ind. Engineering Extension.
A. M. Buswell, and H. F. Mueller.
Proceedings of the Eleventh Industrial Waste Conference, Series No. 91, p.160-165, 1956.

Descriptors: *Anaerobic digestion.
Identifiers: *Wool, *Wool grease, Lanolin, Experimentation.

In the scouring of raw wool with soap and alkali to remove foreign matter, the waste waters have an extremely high BOD and are very polluting. The usual method of treatment involves addition of H2SO4 and sedimentation to remove grease and sludge, but the sedimentation tank effluent still requires dilution before discharge to the sewers. Wool grease consists of the suint and fat (largely lanolin). Experiments were made on raw wool wherein it was submitted to anaerobic fermentation. Most of the grease and other organic contaminants, other than lanolin, were decomposed and the wool fibers were unharmed. Sand and solids settled. Potash can be concentrated. No large scale trials are reported. (Work-North Carolina State Univ)

SODIUM HYDROXIDE RECOVERY IN THE TEXTILE INDUSTRY,
Purdue Univ., Lafayette, Ind.
C. S. Carrique, and L. U. Jauregui.
Proceedings of the 21st Industrial Waste Conference, Engineering Extension Series No. 1212, Vol. 50, Part 2, p861-868, 1966.

Descriptors: Costs.
Identifiers: *Textile mill wastes, *Caustic, Mercerizing, Cotton fabrics.

Because of the high cost of caustic in Argentina, it is recovered from the operations of a textile mill processing 2,000 metric tons of cotton per year. The caustic is mainly used in the mercerizing process. The caustic solution is filtered, concentrated in a two-stage evaporator, and refiltered for reuse. A saving of about $20,000 (U.S.) per year is achieved and water pollution is prevented. (Work-North Carolina State Univ)
W70-04637

THE ECONOMICS OF URBAN SEWAGE DISPOSAL,
California Univ., Riverside. Dept. of Economics.
Paul B. Downing.
Available from Frederick A. Praeger, Publishers, 111 Fourth Avenue, N.Y., N.Y. 10003, for $15 per copy. New York: Frederick A. Praeger, Publishers, 1969. 196 p, 38 tab, 13 fig, 58 ref, 1 append.

Descriptors: *Evaluation, *Cost-benefit analysis, *Sewage disposal, Sewers, Cost comparisons, Costs, Cost analysis, Estimated costs, Estimated benefits, Wastewater disposal, Domestic wastes, Municipal wastes, Marginal costs.
Identifiers: Wastewater treatment costs, Wastewater collection costs, Garbage grinders, Effluent charges.

Cost-benefit analyses were applied to the collection and treatment of urban sewage (excluding storm water runoff) with the following results: (1) The cost per capita per million gallons per day of volume for collection, transmitting, and treating sewage declined as the number of people served increased. (2) A net savings of $1.55 per person yearly would accrue to a municipality if individual garbage grinders were used in lieu of garbage collection. (3) To assess the cost of the variation in flow in a fixed-capacity treatment plant, the cost of increasing the sewer capacity reserved for each individual by 25 gallons per day was estimated to be 3 cents per capita per year per mile of sewer. (4) If a plant serving 100,000 people were increased in capacity to treat the expected hourly peak flow at 90 percent, the cost of treatment would increase from $2.07 to $3.48 per capita per year. (5) Treatment facilities should be expanded to service urban 'fringe' areas, if soil conditions are poor and if there is a net external cost to the septic tank system. (6) The marginal cost of serving an increase in urban population density was estimated to be 64 cents per capita per year. (7) For a hypothetical urban complex of 102,400 people, with varying population densities, one treatment plant was always cheaper than two plants. (8) A city of 10,000 would have to be less than ten miles from the edge of a city of 100,000 before it would be economical to send the small city's sewage to the large city's plant. (9) Large savings in pollution damage would be necessary before a regional treatment plant would be economically feasible. (10) The effluent charge system for waste discharge should be adopted to enhance the 'stream standard' for water quality. (11) Three special charges to aid financing of urban sewage facilities were suggested: (a) A special adjustment of rates to allow for differences in sewage strength for large industrial customers, (b) A higher peak load price for large customers who release widely varying loads, and (c) A special charge for customers who do not install a garbage grinder.

DILUTE SOLUTION REACTIONS OF THE NITRATE ION AS APPLIED TO WATER RECLAMATION,
Robert A. Taft Water Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
Frank C. Gunderloy, Jr., Cliff Y. Fujikawa, V. H. Dayan, and S. Gird.
Available from the Clearinghouse as PB-190 195, $3.00 in paper copy, $0.65 in microfiche. Federal Water Pollution Control Administration, Cincinnati, Ohio, Robert A. Taft Water Research Center Report No. TWRC-1, Oct, 1968. 67 p, 14 tab, 232 ref, 1 append. FWPCA Project 17010---10/68, Contract No. 14-12-52.

Descriptors: *Nitrates, Wastewater treatment, *Denitrification, Catalysis, Bibliographies, *Reduction (Chemical), *Water reuse, Chemical reactions.
Identifiers: Ferrousion, Cupric ion.

A new and unexpected partial denitrification of dilute nitrate ion solutions (10 to 50 ppm NO3-N) has been achieved by treatment with 8 moles of ferrous sulfate per mole of nitrate in unbuffered alkaline reactions. The nitrogen loss, which probably represents evolution of N2 or N2O, has been as high as 50%. Total reduction to lost nitrogen plus nitrite and/or ammonia has approached 100%. The reduction takes place in the presence of partially oxidized black iron hydroxides, and requires catalytic quantities of cupric ion. Denitrification is suppressed by phosphates, as well as by several other factors, some as yet unidentified. Silver ion catalysis or a 16-fold excess of the ferrous salt permits reduction to ammonia in the presence of phosphate, but there is no accompanying denitrification. A literature survey resulted in the selection of 232 references.

PROBABILISTIC VARIATIONS IN ULTIMATE FIRST STAGE BOD,
Illinois State Water Survey, Peoria. Water Quality Section.
Veerasamy Kothandaraman.
ASCE Proceedings, Journal Sanitary Engineering Division, Vol 96, No SA1, Paper 7054, p 27-34, February 1970. 8 p, 3 fig, 1 tab, 9 ref, append

Descriptors: *Biochemical oxygen demand, *Biochemistry, Oxidation, Oxygen sag, Dissolved oxygen, Probability, Sewage treatment, Water pollution effects, Statistical methods, Statistical models.
Identifiers: Biochemical reaction rates.

Variations in the ultimate first stage BOD are found to be lognormally distributed under the hypothesis that the bacterial oxidation of organic matter is a first order reaction, and that the deoxygenation coefficient is normally distributed with known parameter values of mean and variance. In the exponential decay curve for the ultimate first stage BOD, the variance in predicting ultimate BOD increases with increase in time. Expressions for the mean, variance, and modal values of the ultimate first stage BOD are presented. (Knapp-USGS)

GROUNDWATER RECHARGE DESIGN FOR RENOVATING WASTE WATER,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
Herman Bouwer.
ASCE Proceedings, Journal Sanitary Engineering Division, Vol 95, No SA1, Paper 7096, p 59-74, February 1970. 16 p, 10 fig, 1 tab, 20 ref.

Descriptors: *Artificial recharge, *Water spreading, *Water reuse, *Tertiary treatment, Infiltration, Filtration, Sewage treatment, Sewage disposal, Hydrogeology, Groundwater movement, Water resources development, Reclaimed water.
Identifiers: Phoenix (Ariz), Salt River (Ariz).

Soil and hydrogeologic conditions permitting, groundwater recharge by surface spreading is an economic and esthetic way for further treatment or renovation of secondary sewage effluent, cannery wastes, or similar low-quality water. The design of a system of spreading areas with wells or drains for collecting the reclaimed water should generally be based on: (1) A maximum limit for the elevation of the water table mound beneath the spreading areas; (2) a minimum limit for the underground detention time and travel distance as the water moves to the wells or drains; and (3) minimum contamination of the groundwater in the aquifer outside the recharge system. Hydraulic properties of aquifers, including anisotropy, can be determined by analog and by field measurements. These data are used to evaluate the effective transmissibility for recharge, and to calculate water-table positions and underground detention times for a system of long, parallel spreading strips with wells midway between the strips. (Knapp-USGS)

A STUDY ON TREATMENT OF WOOL SCOURING LIQUORS,
Lawrence Experiment Station, Mass.
J. A. McCarthy.
Sanitalk, Vol. 3, No. 3, p17-18, 1955.

Descriptors: *Waste water treatment, *Coagulation, Test procedures, Hydrogen ion concentration, Recirculated water, Calcium chloride.
Identifiers: *Wool grease recovery, *Biological filtration, *Scouring waste, Liquor treatment, Wool scouring liquors, Recirculating filters.

Studies on the treatment of wool scouring waste waters made by the Lawrence Experiment Station, Massachusetts, have shown that coagulation with CaCl2, usually 2% by weight, with the introduction of live steam with adjustment of pH value gives up to 98% reduction in concentration of grease and 66% reduction in BOD. The treated waste waters still contain about 500-800 ppm grease and have a BOD of 4000-7000 ppm. To assess the permissible loading and probably removal of BOD in treatment of the waste waters by biological filtration, several series of filters were operated, the liquor being ap-

plied in a mixture with rinsing waters which are usually available in volumes 3 to 10 times greater than those of scouring waste waters and have a relatively low BOD and grease content. The loading applied to the filters was usually 2000 lbs/acre-ft. and the proportion of liquor to rinsing waters applied to two recirculating filters in series varied from 25% to 10% scouring liquor, the corresponding reduction in BOD of the mixture increasing from 60 to 83%. The grease content was reduced by 90%. These results indicate that wool scouring liquors with a BOD of 16,000 before coagulation can be treated by two-stage biological filtration after dilution with 90% rinsing waters. ADVANCES IN WATER QUALITY IMPROVEMENT-WATER RESOURCES SYMPOSIUM NO. 1.
Texas Univ., Austin.

Edited by Earnest F. Gloyna and W. Wesley Eckenfelder, Jr. Austin, Texas, University of Texas Press, 1968. 513 p.

Descriptors: *Waste disposal, *Wastewater treatment, *Streams, *Rivers, *Biological treatment, *Industrial wastes, *Pollution abatement, Ecology, Biological properties, Anaerobic digestion, Flocculation, Filtration, Surfactants, Eutrophication, Lakes, Saline water.
Identifiers: *Waste stabilization ponds, *Biological oxidation, *Anaerobic treatment, Activated sludge plants, Aerated lagoons, Mathematical modeling of mixing.

Text consists of a series of 38 special lectures presenting current practices and advances in wastewater analysis, treatment and disposal. The text reflects its stated objective of demonstrating that wastewater management encompasses virtually every water resource activity. Section One of the book discusses the broader aspects of water resources conservation, the transport and dispersion of wastes in streams and the ecology of aquatic environments. The special lectures indicate the many facets of these factors which involve problems in economics, management, hydraulics, stream ecology, and mathematical modeling of various mixing phenomenon. Section Two contains lectures which examine and explain current specific concepts and theories in advanced biological waste treatment, including illustrations of the most recent improvements in process design. Section Three discusses current trends and advances in: (1) low-cost treatment practices, (2) use of waste stabilization ponds for biological treatment of wastewater containing organic pollutants, (3) development of design criteria and relevant significant innovations. (See also W70-04762 thru W70-04794). (D'Arezzo-Texas)

WATER RESOURCES VALUES,
Resources for the Future, Inc., Washington, D.C.
Allen V. Kneese.
Advances in Water Quality Improvement, (Editors: E. F. Gloyna and W. W. Eckenfelder, Jr), Austin, Texas, Univ of Texas Press, 1968, p 3-8, 3 ref.

Descriptors: *Cost-benefit analysis, *Cost comparisons, *Industrial water, *Municipal water, *Value, *Waste treatment, Water quality, Water resources, Pollutants, Cost analysis, Municipal wastes, Dissolved oxygen, Management.
Identifiers: *Economic and system analysis, *Regional systems approach, *Low-quality water treatment, ORSANCO, INCODEL, Delaware River estuary, Clean Rivers Restoration Act, Hudson River, Rhine River, Philadelphia.

A discussion of water resources values is presented stemming from the basic premise that the net value of water quality in water courses is a function of both the benefits resulting from improved water quality versus costs of attaining the specified quality. Author finds that while progress has been made in pollution control, serious problems continue, notably the problem of residuals in treated municipal wastes and control of industrial waste. The regional systems approach is suggested for the solution of the water pollution problems. Conclusions are reached that both costs and gains of quality improvement must be considered in determining the maximum net value of rivers. Finally, it is contended that scientific and engineering developments can be applied rationally and systematically provided their economic and institutional impacts also are understood and considered in the evaluation process. As illustration, municipal waste treatment costs double when waste removal from effluent is increased from 90% to 96-97%. Costs triple in increasing removals from 97% to 100%. Also cited are the cost implications of various alternatives regarding increased dissolved oxygen states in the Delaware River estuary. (See W70-04761). (D'Arezzo-Texas)
W70-04762

ECOLOGICAL CHANGES IN A POLLUTED ENVIRONMENT.
Illinois Univ., Urbana.
John H. Austin, and R. S. Englebrecht.
Advances in Water Quality Improvement, (Editors: E. F. Gloyna and W. W. Eckenfelder, Jr.), Austin, Texas, Univ of Texas Press, 1968, p 9-20, 7 fig, 3 tab, 23 ref.

Descriptors: *Ecology, *Nutrients, *Dissolved oxygen, *Bacteriophage, *Viruses, *Biological communities, Biological treatment, Chemical analysis, Temperature, Oxygen demand, Velocity, Waste treatment, Wastewater treatment, Benthos.
Identifiers: *Long-term ecological changes, *Flow factors, *Persistence of bacteria, Nematode concentration, Salmonellae, Benthic community, Nutritional groups.

The discussion ensues from two basic questions: (1) How might the information available today be used to predict the effect of waste on a given stream. (2) If the knowledge available today is inadequate, what additional information is needed. The authors suggest that the study of ecological changes in a polluted aquatic environment is an experiment in the inter-relationships of the scientific disciplines involved. Thus, the individual efforts of chemists, biologists, engineers, and others are presented to demonstrate the durability of correlated efforts to understand the ecological changes in a polluted environment. For example, biochemical process of oxygen utilization may be controlled in part by a physical process such as the stream velocity in which the organism lives. The coliform titer of a stream may be greater when receiving a chlorinated wastewater effluent than an unchlorinated (but otherwise comparable) effluent. Conventional bacteriological indicators of pollution may be misleading insofar as viral contents are concerned. Only by detailed analysis of the many-faceted ecological picture can some of the complicated problems of the polluted environment be solved. (See W70-04761). (D'Arezzo-Texas)
W70-04763

OBJECTIVES, TECHNOLOGY, AND RESULTS OF NITROGEN AND PHOSPHORUS REMOVAL PROCESSES,
Eidgenoessische Technische Hochschule, Zurich (Switzerland).
Karl Wuhrmann.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F. and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 21-48, 11 fig, 8 tab, 35 ref.

Descriptors: *Activated sludge, *Costs, *Cost comparisons, *Denitrification, *Phosphorous compounds, *Nitrogen compounds, *Sewage, *Biological treatment, Design, Phosphates, Concentration, Temperature, Lime, Iron Pollutants.
Identifiers: *Endogenous denitrification, *Post-precipitation, *Sludge loads, *Sedimentation curve, *Precipitation unit, Nutrient removal, Anaerobic plants, Final effluent, Settled sewage, pH, Iron (III).

Discussed are the objectives of nutrient removal processes, the types and amounts of nutrients to be removed and the perspective success of tertiary treatment. Paper analyzes procedures for the elimination of phosphorus from sewage, including a thorough explanation of iron (III) as a precipitant, phosphorus elimination using lime and, phosphorus removal using both lime and iron (III). The removal of nitrogen compounds from sewage is discussed from the viewpoints of general process layout, the process of nitrification in activated sludge treatment, denitrification by activated sludge, the role of oxygen as a limiting factor, the respiration substrates as limiting factors and results of practical experiments with denitrification conducted at a pilot plant station. Discussed are certain cost-justifiable, beneficial side effects of nitrogen and phosphorus removal processes. Also presented are detailed estimates of annual and net operation costs and design factors for phosphorus and nitrogen removal plants. Conclusions are reached that the conventional biological treatment will still represent the basis of all further purification steps, both for economic and process reasons. Further, past scientific and monetary investment in sewage purification will not lose its value, not even in view of eventual totally new procedures generated by demands for much higher, sewage effluent qualities. (See W70-04761). (D'Arezzo-Texas)
W70-04764

BIOLOGICAL RESPONSES TO NUTRIENTS-EUTROPHICATION: PROBLEMS IN FRESHWATER,
Texas Univ., Austin.
E. Gus Fruh.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F. and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 49-64, 7 tab, 82 ref.

Descriptors: *Eutrophication, *Nitrogen compounds, *Phosphorus compounds, *Nutrients, *Bioassay, *Runoff, *Lakes, *Impoundments, Tertiary treatment, Algae, Domestic wastes.
Identifiers: *Micronutrients, *Nutrient interactions, *Radiocarbon bioassay, *Nutrient types, Microquantities, Macroquantities, Algal blooms, Liebig's Law of the Minimum, Voisin's Law of the Maximum.

The purpose of the presentation is to provide a framework of reference on the eutrophication problems of freshwater. Important insights on eutrophication have come from the fields of botany, limnology, and sanitary engineering. Discussed are the types and impacts of critical nutrients. Special attention is focused on nitrogen, and phosphorus, including a detailed discussion of specific sources, namely rainfall, groundwater, forest runoff, agricultural runoff, urban drainage and wastewater effluents. Analysis is made of the relationship of nuisance conditions to nitrogen and phosphorus. Examination is made of the role of organic and inorganic micronutrients; the nature of nutrient interactions with various physical, chemical, and biological variables. Various approaches to control eutrophication are reported. Conclusions are reached that other than tertiary treatment, diversion of the nutrient-rich sources appears the most feasible eutrophication control. However, leaching or bacterial decomposition of nutrients from the sediments seems the limiting factor in lake recovery rates. Many processes in aquatic environments are attributed to bacteria, however, current analytical techniques are inadequate for the quantitative evaluation of bacterial species and number. (See W70-04761). (D'Arezzo-Texas)

Identifiers: *Texas coast, *Species diversity, *Metabolic rates, Oil field brine-bleedwater, Petrochemical industry wastewaters, Seafood packing wastewaters, Pulp mill wastes.

This presentation examines and describes the major effects of the many nutrient-laden effluents on the estuaries, bays and lagoons along the Texas coast. It is found that the addition of a known nutrient source to a marine community resulted in changing ecosystem metabolic patterns. Increase in nutrient caused an increase in photosynthetic production. Species diversity of zooplankton is reduced in marine environments receiving some types of organic wastes indicating community disruption can result by new nutrient influxes. Toxic effects are not always detectable by conventional measurement methods. With a slight increase in mortality rate, the fish biomass affected would be decreased greatly. Experiments on fish metabolic rates showed that slight pollution stresses lower the metabolic rates greatly. The lowering was maximal when the fish were already subjected to an initial environmental stress, such as low temperature. Most of the effects of waste effluents on marine environments are subtle. It is believed that analyses based on the community rather than on the organismic approach are more practical in evaluating man-caused effects on inland saline ecosystems, even though the effects of stresses on individual populations can be physiologically quantifiable. (See W70-04761). (D'Arezzo-Texas)

ECOLOGICAL ASPECTS OF STREAM POLLUTION,
Texas Univ., Austin.
Neal E. Armstrong, and Earnest F. Gloyna.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F. and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968, p 83-95, 7 fig, 25 ref.

Descriptors: *Ecology, *Respiration, *Oxygen demand, *Ecosystems, *Model studies, *Stability, Plant growth, Energy, Design, Classification.
Identifiers: *Species-diversity index, *Diurnal curve, *Stream pollution, *Energy exchanges, *Gas exchanges, *Nutrient flows, *Energy-P/R relationship, Trophic levels, Organic transfer, Univ of Texas, Reaeration coefficient.

Two methods of evaluating the effects of pollution on the ecological system are presented, which furnish valuable information to the engineer regarding the condition and stability of ecological systems in receiving waters, and may ultimately become design criteria. Gases, nutrients and energy interchanges take place between components of the ecosystem. Gas exchange is related to plant and animal activities in photosynthesis and respiration; nutrient flows relate to the recycling processes and, energy integrates the ecosystem and can be described in thermodynamic terms. The species-diversity index method-the relation of individuals to species--has been used in comparing types of waters. The diurnal curve method has been used to find the total oxygen production and respiration in natural waters. Ecosystems may be classified according to oxygen production (P) and respiration (R) values and also their P/R ratios. Correlational analyses between energy stabilization and the P/R ratios afford significant insights into specific pollutional effects on ecosystem stability. Model studies at Univ of Texas are attempting to develop predictive curves for (P) and (R) against various waste parameters. (See W70-04761). (D'Arezzo-Texas)

ANALYSIS OF THE DISSOLVED OXYGEN VARIATION IN A FLOWING STREAM,
Manhattan Coll., Bronx, N.Y.
Donald J. O'Connor, and Dominic M. Di Toro.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 96-102, 4 fig, 5 ref.

Descriptors: *Dissolved oxygen, *Continuity equation, *Reaeration, *Photosynthetic oxygen, *Natural streams, Variability, Aeration, Differential thermal analysis, Carbonates, Nitrogen compounds.
Identifiers: *Dissolved oxygen concentration, *Sources and sinks of oxygen, *Mass balance equation, *Natural aeration, *Artificial aeration, *Dissolved oxygen deficits, Fourier series expansion, Grand River, Lansing (Mich).

An analytical, mathematical example is presented which gives some insight into the complex relationships governing the oxygen balance in streams. The distribution of dissolved oxygen in a natural stream is definable by the continuity or mass balance equation in mathematical differential equation form. The equation describes temporal dissolved oxygen variation according to a spatial distribution along the axis of stream flow, and assumes a uniform concentration over the stream cross-section area. Both flow and cross-section area can be functions of space and time. The oxygen sources and sinks can be space, time and concentration functions. The concentration of dissolved oxygen is selected for this analysis. (However equation is applicable to any substance.) The sources of oxygen are the tributary inflows and brought about by natural or artificial aeration and by photosynthetic activity of green plants. The sinks of dissolved oxygen include biochemical oxidation of organic matter, use by benthal deposits and by aquatic plant respiration. Each of the above cited parameters are formulated into mathematical components of the continuity or mass balance equation. An illustrative analysis is made of the oxygen distribution in the Grand River near Lansing, Michigan. (See W70-04761). (D-'Arezzo-Texas)

RELATIONSHIP BETWEEN THE PHYSICAL AND BIOLOGICAL ENVIRONMENTS - PHYSICAL EXCHANGE,
Texas Univ., Austin; and Louisiana Polytechnic Inst., Ruston.
Frank D. Masch, and Joe R. Wilson.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 103-110, 17 ref.

Descriptors: *Natural streams, *Diffusion, *Dispersion, *Turbulent flow, *Mathematical studies, *Eddies, *Pollution abatement, *Theoretical analysis, Flow characteristics, Estuaries, Reynolds Number.
Identifiers: *Fick's Laws of Diffusion, *Coefficient of diffusion, *Physical exchange, Assimilative capacity, Brownian motion, Molecular diffusion, Non-isotropic diffusivity, One-dimensional diffusion, Three-dimensional diffusion, Differential continuity equation, Prandtl's mixing length.

The efficient us of assimilative capacities of natural streams requires knowledge of the vital mixing, dispersion, diffusion and physical exchange processes. The term 'coefficient of dispersion' is normally used to describe the apparent diffusivity resulting from all mixing and exchange processes. A thorough theoretical analysis traces the mathematical expression of the process of diffusion from Fick's Laws of Diffusion through the analytical postulations of Prandtl based on the kinetic theory of gases, on to various empirical simplifications regarding shear flow mixing by subsequent investigators. Theoretical methods cannot always be based on a time-independent coefficient of dispersion Before any analytical solutions of the diffusion equation can be obtained, the dispersion coefficient must be known, assumed, or measured; and generalizations must be made for variations in stream and estuary velocity, cross-sectional areas, and the dimensionality of flow. In any event, these assumptions are complicated by the intrusion of numerous variables and the usual prevalence of non-uniform, unsteady turbulent flows. Nevertheless the joint use of mathematical analytical methods and sampling programs may serve useful planning purposes. (See W70-04761) (D'Arezzo-Texas)
W70-04769

MATHEMATICAL MODELING OF MIXING PHENOMENA IN RIVERS,
Boeing Co., Huntsville, Ala.; and Vanderbilt Univ., Nashville, Tenn.
James R. Hays, and Peter A. Krenkel.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 111-123, 7 fig, 2 tab, 16 ref.

Descriptors: *Mathematical models, *Mixing, *Rivers, *Continuity equations, *Tracers, *Flow characteristics, *Laboratory tests, *Flumes, *Forecasting, *Mass trasfer, *Stagnant water, Flow rates.
Identifiers: *Turbulent flow, *Dead zone model, *Longitudinal mixing coefficients, Differential equations, Kalmogoroff's similarity principle, Concentration-time curves, Dispersed flow, Tennessee Valley Authority, Prediction.

Natural processes of waste dilution and purification in rivers, streams, lakes, and reservoirs are enhanced by natural mixing and dispersion. These phenomena require ample time and distance. Effective means of predicting the natural mixing and dispersion capabilities of receiving waters would enable better pollution control. Available field data usually indicates higher values when compared to mathematical models successfully tested in laboratory flumes. To ascertain the causes of this discrepancy, an analysis is made of the relevant mixing theories and empirical, numerical expressions including the continuity equations for turbulent flow and pipe flow methods for computing the longitudinal mixing coefficient using experimental data, hydraulic parameters, and Kolmogoroff's similarity principle. A so-called 'dead zone' model is proposed which takes into account stagnant areas, usually existing in receiving waters and the inadequacies of the one-dimensional representation of the mixing phenonemon are discussed. This model assumes that part of the tracer material injected in a river enters stagnant zones from which it emerges slowly. Model was tested in a laboratory flume and in several TVA rivers. Observed and predicted time-tracer concentration curves compared favorably. (See W70-04761). (D'Arezzo-Texas)

BIOLOGICAL AND PHYSICAL RESPONSES IN A FRESHWATER DISSOLVED OXYGEN MODEL,
Resources for the Future, Inc., Washington, D.C.; and California Univ., Berkeley.
Richard J. Frankel, and William W. Hansen.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F. and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 126-140, 4 fig, 1 tab, 17 ref.

Descriptors: *Dissolved oxygen, *Model studies, Waste assimilative capacity, *Photosynthesis, *Respiration, *Oxygen demand, *Mathematical models, *Computer models, Mixing, Waste disposal, Oxygen sag, Sediments, Digital computers.

Identifiers: *Oxygen profile equations, Streeter-Phelps equation, *Stream quality, *Water quality, Case studyoFlint River-Lansing, (Mich), Management, Model applicability, Model sensitivity.

An expression has been developed to predict the spatial and temporal variations in dissolved oxygen concentrations in receiving natural waters. A case study, using digital computer methods, shows the validity of oxygen profile equations, provided proper inputs are used. Input data needed for complete use of the mathematical model showed that present stream survey practices do not afford enough data to describe the biological and physical responses in a stream. Data collection should be governed by sensitivity analysis namely, extent and oxygen demand of the sediments, biological extraction rate of attached organisms, and maximum rate of oxygen production (consumption) by photosynthesis (respiration). Diurnal fluctuations in waste loads, variations in reaction rates, and photosynthetic action in the stream have stronger effects on resulting conditions than generally believed. There is need for improving present predictive techniques used in evaluating pollution effects. (See W70-04761). (D'Arezzo-Texas)

RESEARCH DEVELOPMENTS IN REGARD TO CONCEPT AND BARE VALUES OF THE ACTIVATED SLUDGE SYSTEM,
Eidgenoessische Technische Hochschule, Zurich (Switzerland).
Karl Wuhrmann.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 143-170, 5 fig, 15 tab, 21 ref.

Descriptors: *Activated sludge, *Research and development, *Oxygen, *Growth rates, Bacteria, Photosynthetic bacteria, Photosynthesis, Respiration, Nitrification, Ammonia, Treatment facilities, Trickling filters, Fermentation, Assay.
Identifiers: *Excess sludge production, *Removal efficiencies, *Organic carbon, *Organic nitrogen, *Sludge-loss factor, Plant operation, Oxygen consumption, Sludge plants, Concept of continuous operation, Sludge loads.

The influence of hydraulic load, solids and oxygen concentration, and the temperature of the mixed liquor on the performance of the activated sludge process was investigated. A complete block factorial design experiment was conducted where the independent variables were tested at 3 levels temperature at 2 levels. A set of assays was evaluated on the basis of the theory of continuous fermentation in a completely mixed reactor. Studies were made of main actions and interactions of the independent variables on removal of organic carbon, organic nitrogen, BOD, and on production of excess sludge. Estimates are given of the gross yield factor in terms of organic carbon for calculation of excess sludge quantities. Growth rate of the bulk of sludge organisms is discussed. A causal formula is developed for finding the oxygen consumption in an aerator. Numerical values for endogenous and substrate respiration as function of plant operation parameters are presented based on experimental operations. There is a need for more reliable data on growth rates of sludge organisms and a better knowledge of the magnitude of the sludge loss factor under various conditions. (See W70-04761). (D'Arezzo-Texas)
W70-04772

CONCEPTIONS AND MISCONCEPTIONS IN BIOLOGICAL OXIDATION,
Rice Univ., Houston, Tex.
A. W. Busch.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 171-175, 5 ref.

Descriptors: *Systems analysis, *Mathematical models, *Biological treatment, *Activated sludge, *Trickling filters, Nitrates, Nitrogen, Oxygen.
Identifiers: *Fluidized culture systems, *Biological oxidation, *Anaerobic systems, *Film-flow biological reactor, Warburg apparatus, Curve-fitting, Methane forming organisms.

Water technology is being pressed between concepts based on conventional, stereo-typed system design and new scientific knowledge. Two concepts derived from interdisciplinary activities are systems theory and mathematical models. As a result many misconceptions have arisen. Using examples in various facets of biological oxidation processes and concepts it is demonstrable that, generally, systems knowledge is more powerful than systems theory. Also, the equations of mathematical models and thermodynamic analysis must be descriptive before they can be used predictively. The following specific oxidational processes and concepts were analysed: (1) fluidized culture systems, (2) the use of nitrates as a source of 'chemical oxygen' in biological oxidation, (3) anaerobic systems which have assumed traditionally a two-stage sequence of biological reactions which exclude exogeneous hydrogen acceptors and depends on methane-forming organisms, and (4) the film-flow biological reactor. With respect to mathematical modeling the point is made that the model should serve as a description to work from rather than toward. And, in general, systems theory places serious overall limitations on processes; this is illustrated in specific cases regarding fluidized culture process. (See W70-04761). (D'Arezzo-Texas)
W70-04773

REMOVAL OF NITROGEN BY BIOLOGICAL TREATMENT,
Minnesota Univ., Minneapolis.
Walter K. Johnson.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, univ of Texas Press, 1968. p 178-189, 4 fig, 2 tab, 38 ref.

Descriptors: *Biological treatment, *Nutrients, *Nitrification, *Denitrification, *Flow control, Nitrogen, Phosphorus, Wastewater treatment, Ecology, Eutrophication, Activated sludge, Trickling filters, Dissolved oxygen, Aeration, Control, Disposal, Incineration, Digestion.
Identifiers: *Nitrogen removal, *Wastewater effluent, Bioprecipitation processes, Stabilization ponds, Semiaerobic activated sludge process.

From data now known, it appears that reduction of nitrogen and phosphorus in wastewater plant effluents is vital in controlling eutrophication. However, other ecological factors may determine whether nitrogen or phosphorus, alone, limit algal growth in any given situation. Thus, the removal of solids and elements other than nutrient elements should not be neglected. Total solids removals may be necessary. Until higher degrees of removal are deemed necessary and economically feasible much can be done to increase the efficiency of nitrogen and phosphorus removal capabilities in plants and processes. Specific analyses and improvement suggestions are presented regarding: (1) the physical methods of removal, (2) bioprecipitation processes, (3) stabilization ponds, (4) nitrification and denitrification processes, and (5) nitrogen disposal. (See W70-04761). (D'Arezzo-Texas)
W70-04774

FACTORS TO BE CONSIDERED IN THE DESIGN OF ACTIVATED SLUDGE PLANTS,
Water Pollution Research Lab., Stevenage (England).
A. L. Downing.
Advances in Water Quality Improvements, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, University of Texas Press, 1968. p 190-202, 8 fig, 14 ref.

Descriptors: *Design, *Activated sludge, *Aeration, *Oxidation, *Nitrification, Retention, Sewage, Ammonia, Temperature, Effluents.
Identifiers: *Longitudinal mixing, *Biological oxidation, *Loading, *Sludge settleability, *Sludge dewaterability, *Sludge production, Nitrified effluents, Carbonaceous matter, Biological oxygen demand, Retention period, Sewage retention, Carbonaceous oxidation.

To approach closer to optimization in the design of an activated sludge plant of required capacities more data is needed pertaining to the inter-relationships between operating variables and performance. Laboratory studies have revealed some ways of improving plant performance through design and operational changes. The effects of retention period and loading are examined in the specific areas of nitrified effluent production, carbonaceous matter removal, sludge production and sludge settleability and dewaterability. The degree of longitudinal mixing in aeration units with important effects heretofore seemingly neglected, are also examined. The status of knowledge on effects of mixing on biological oxidation, and the effects of mixing and concentration on the influence of inhibitory substances are analyzed. An assessment is made of the patterns, capacities, rates and efficiencies of aeration processes and methods. (See W70-04761). (D'Arezzo-Texas)
W70-04775

DEVELOPMENTS IN BIOLOGICAL FILTRATION,
Cornell Univ., Ithaca, N.Y.
Vaughn C. Behn, and Parviz Monadjemi.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univerisity of Texas Press, 1968. p 204-214, 3 fig, 18 ref.

Descriptors: *Biological treatment, *Filtration, *Mathematical studies, *Trickling filters, *Mathematical models, Biochemical oxygen demand, Filters, Waste treatment, Flow characteristics, Design.
Identifiers: *Biological filtration, *Empirical models, *Recirculation filters, *Reaction kinetics, *Flow patterns, *High-rate trickling filters, Mass transfer coefficients, System design, Plug-flow, Mixed-flow.

A review is made of the major empirical and mathematical formulations for single-stage filters and recirculating filters and to define the process action of trickling filtration. Recirculation is an established fact with the operation of high rate trickling filters, affording uniformity and equalization of loadings, flexibility of plant operation and, beneficial seeding effects on plant influent. Some new concepts are presented concerning certain major factors which affect the performance of a biological treatment system. A continuous flow system includes some reactor (i.e., an activated sludge, a trickling filter or a sedimentation basin process) which has the function of reducing some undesirable property associated with the flow. The efficiency of such a system depends mainly on: (1) the type flow pattern of material passing through the system and, (2) the kinetics of the reaction itself. The effects of plug flow and completely mixed flow patterns on the efficiency of a system undergoing a first-order treatment reaction are described. The importance of bacterial concentration in most biological treatment systems regardless of the type of flow pattern is emphasized. Practical observations are made on the relationships of flow to bacterial concentration in determining the efficiency of trickling filter systems. (See W70-04761). (D-'Arezzo-Texas)
W70-04776

NEW CONCEPTS IN OXYGEN TRANSFER AND AERATION,
Texas Univ., Austin.
W. Wesley Eckenfelder, and Davis L. Ford.

Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, University of Texas Press, 1968. p 215-236, 14 fig, 3 tab, 27 ref.

Descriptors: *Aeration, *Oxygen, *Transfer, *Diffusion, *Mixing, *Surfactants, *Temperature, *Equations, *Design data, Mass transfer, Activated sludge, Equipment (Aeration), Bubbles (Aeration), Turbulence.
Identifiers: *Overall transfer coefficient, *Liquid film coefficient, *Mass transfer coefficients, *Oxygen transfer efficiency, Deoxygenated water, Steady-state aeration, Nonsteady state aeration, Mixing intensity, Surface active agents, Diffused aeration, Turbine aeration.

A general review is made of recent concepts in oxygen transfer and the practical data for design of aeration equipment is summarized. The theory and general development of the mechanism of oxygen transfer under quiescent and turbulent conditions are discussed. The most significant factors influencing the important overall transfer coefficient and the liquid film coefficient are temperature surface active agents in the liquid, and mixing intensity. Empirical mathematical expressions are presented for the temperature effect and for the film of excess surface concentration of surfactant molecules which serves as a barrier to diffusion. The effects of various mixing intensity ratios on oxygen transfer rates, under various aeration systems and flow regimes are shown graphically. The most commonly-accepted techniques used to determine aeration equipment performance efficiency and capabilities are: (1) nonsteady state aeration of deoxygenated water, (2) steady-state and nonsteady-state aeration of activated sludge, and (3) steady-state aeration of tap water. Aeration equipment used for sewage and industrial waste treatment consists of air diffusion units, turbine aeration systems in which air is released below the rotating blades of an impeller, and surface aeration units in which oxygen transfer occurs by virtue of high surface turbulence and liquid sprays. (See W70-04761). (D'Arezzo-Texas)
W70-04777

AERATION DEVELOPMENTS IN EUROPE,
Technische Hochschule, Vienna (Austria).
Wilhelm Von der Emde.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univerisity of Texas Press, 1968. p 237-261, 23 fig, 1 plate.

Descriptors: *Aeration, *Diffusion, *Oxygenation, *Absorption, *Efficiencies, *Energy, *Sewage treatment, Bubbles, Design. Detergents, Baffles, Circulation, Design data.
Identifiers: *Danjes system, *Cone aeration, *Saran-tube aerator, *Brandol-tube aerator, *Plastic-box aerator, *Germany, Simplex cone, Oxygen absorption, Europe, Munich, Essen, Hamburg, Simcar cone, Vortair cone, BSK turbine, Mammut-Rotor.

Before the construction of large sewage treatment plants in Austria, investigations were made of major treatment facilities involving large scale aeration processes in Essen, Hamburg and Munich, Germany. The performance and economics of major aeration systems are discussed. The Essen plant tested the oxygenation efficiencies of Saran-tube, plastic box and Brandol-tube aerators under various arrangements as to location and bubble size. Results of the Danjes fine bubble aeration system at Munich are furnished. Results of widespread use of Simplex cone aeration throughout Europe are summarized. Major differences between the Simcar cone aeration system and the Vortair cone system are noted. Special operational and power requirements of the BSK Turbine aeration system is noted. Modifications to aerators and rotors leading to the development of the Mammut-Rotor are explained showing effects of immersion depth on absorbed energy aeration efficiency, and oxygen capacity. Comparisons are made with the Haworth paddle aeration system and the Kessener brush aeration system. (See W70-04761). (D'Arezzo-Texas)
W70-04778

MECHANISM OF INTERFERENCE OF SURFACE ACTIVE AGENTS IN AERATION SYSTEMS,
Michigan Univ., Ann Arbor; and Clemson Univ., S.C.
K. H. Mancy, and W. E. Barlage, Jr.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press 1968. p 262-286, 18 fig, 22 ref, 2 plates.

Descriptors: *Aeration, *Interfaces, *Surfactants, *Physicochemical properties, *Films, *Testing, Gases, Adsorption, Hydrodynamics, Mass transfer, Aerosols, Reynolds number, Mixing.
Identifiers: *Bubble aeration, *Stream aeration, *Surface aeration, *Liquid laminar jet system, *Gas transfer, *Surface active agents, Interfacial resistance, Dynamic surface tension, Dynamic surface concentration, Oxygen transfer coefficient.

Continued attention has been given to the effects of water soluble surface active agents, (SAA) on aeration processes. All experiments to date have encountered certain conflicting results which indicate that the presence of SAA in aeration systems may affect greatly the hydrodynamics of the air-water interface and, therefore, the rate of gas transfer. The physicochemical characteristics of the air-water interface have been examined closely in various systems including bubble aeration, stream aeration, surface aeration in stirred vessels, and liquid laminar jet systems. In comparing the results from these three different aeration systems, better understanding has been gained of the mechanism of interference of SAA on gas transfer. The degree of reduction of gas transfer rates caused by SAA in aeration systems depends on the hydrodynamics of the contactor and the chemical properties of the given SAA. There are two types of SAA interference with gas transfer, (depending on the structure and physicochemical properties of the SAA): (1) The SAA adsorbed film covers partially or totally the water surface, blocks dissolution sites at the interface, or distorts intermolecular forces between the gas molecule and the water surface necessary in the dissolution process. (2) The SAA increases the water surface viscosity, suppresses the interface hydrodynamic activity and, forms a viscous subsurface hydration layer. (See W70-04761). (D'Arezzo-Texas)
W70-04779

FLOCCULATION PHENOMENA IN BIOLOGICAL SYSTEMS,
Wisconsin Univ., Madison.
W. C. Boyle, K. Crabtree, E. P. Jaccarino, E. N. Lightfoot, and G. A. Rochlich.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press 1968. p 287-312, 2 fig, 4 tab, 60 ref, 4 plates.

Descriptors: *Flocculation, *Coagulation, *Activated sludge, *Bacteria, *Colloids, *Aggregates, Aeration, Hydrodynamics, Protozoa.
Identifiers: *Biological flocculation, *Rate of collision, *Collision frequency, *Biological systems, *Adhesive forces, *Disruptive forces, *Zoolgoea ramigera, *Bacterial flocculation, Polymerization, Agglomerations (Capsular, gelatinous matrix, protozoan).

There is a need for better understanding of the quantitative aspects of the biological flocculation process such as flocculation rates, size distributions, and effects of aggregates. Determination of these quantitative data requires actions to estimate floc collision rates, to evaluate the effectiveness of collisions and, to measure the relative adhesive and disruptive forces. The literature on colloid coagulation is reviewed to ascertain its usefulness and limitations. Current qualitative theories regarding cohesive forces are reviewed. The qualitative theory of floc formation for pure cultures of Zoogloea ramigera is discussed. Review of factors affecting the rate and size distribution of colloid aggregation is divided into three areas: (1) Population balances, (2) Prediction of collision frequency, which depends mainly on classical kinetic theory and hydrodynamics, (3) Description of disruptive forces, which are mainly hydrodynamic for bacterial flocs, and which tend to provide an upper limit for the size of primary aggregates. The categories of microbial aggregation concepts discussed are: (1) Capsular or gelatinous matrix agglomeration, (2) Colloidal hypotheses, (3) Protozoan agglomeration, (4) Inert matrix and salt-bridging hypotheses, (5) Low-energy concepts, and (6) Polymerization. (See W70-04761). (D'Arezzo-Texas)
W70-04780

INDUSTRIAL WASTE TREATMENT IN AERATED LAGOONS,
Hydroscience, Inc., Leonia, N.J.
John L. Mancini, and Edwin L. Barnhart.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 313-324, 7 fig.

Descriptors: *Industrial wastes, *Waste treatment, *Aeration, *Activated sludge, *Data collections, *Laboratory tests, *Design, Activated sludge, Aerobic treatment, Digestion, Pilot plants, Temperature, Biochemical oxygen demand, Chemical oxygen demand, Suspended load, Economic impact.
Identifiers: *Aerated lagoons, *Low-solids production, *Suspended solids, *Aeration time, *Response function, *System constants and coefficients, *Laboratory data extrapolations, System response, BOD removal, Oxygen requirements, Numerical examples, Operating problems.

Data collection technique can be designed to establish a response function affording economic evaluation and alternative treatment options. A laboratory method is demonstrated which can be used to evaluate, compare, and design activated sludge, low solids production and aerated lagoon treatment systems from a single set of experimental data. The technique of handling activated sludge and aerated lagoon data in a continuous manner has proved effective in evaluating biological treatment systems. Performance predictions can be extrapolated from laboratory data for different waste strengths and aeration detention times. Technique permits determination of equilibrium solids in aerated lagoon systems and solids requiring handling and disposal in activated sludge systems. Methods of predicting aerated lagoon temperatures and performance have been illustrated. Pilot plant data can be studied to find or analyze: response functions for waste under question, ranges for coefficients and system constants, toxicity effects, sludge settling and separation, temperature effects and foaming problems. (See W70-04761). (D-'Arezzo-Texas)
W70-04781

NEW CONCEPTS IN AERATED LAGOON DESIGN AND OPERATION,
Metcalf and Eddy, Boston, Mass.
Clair N. Sawyer.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 325-335, 7 fig, 7 ref.

Descriptors: *Aeration, *Design criteria, *Wastewater treatment, Aerobic conditions, Anaerobic conditions, Equipment (Aeration), Industrial wastes, Land, Activated sludge, Temperature, Biochemical oxygen demand (BOD), Treatment facilities.
Identifiers: *Aerated lagoons, *Mixed aerobic-anaerobic systems, *Aerobic systems, *Aerated

lagoon design, *Multiple aeration units, Heat loss, Temperature loss compensation, Detention time, Trickling filters, Activated sludge, Oxidation ponds, Stabilization ponds.

The aerated lagoon method of wastewater treatment provides economical high-degree treatment, with land requirements ranging from 1 to 10% of those needed for oxidation or stabilization ponds, and not larger than requirements for high-rate rock-type trickling filters. The further potentials and capabilities of the aerated lagoon method are examined in the light of currently improved knowledge of biological phenomena and other environmental factors. An analytic comparison is made of the mixed aerobic-anaerobic lagoon system versus the aerobic system; the choice in any given project requires careful engineering evaluation. Temperature considerations enter prominently in aerated lagoon system design in view of the excellent heat--dissipating properties afforded and the close relationship between BOD removal and temperature. The major advantage of the aerated lagoon over other methods of biological treatment is its great diluting capacity and ability to handle highly varied types of wastewaters. One of the major problems of design is the selection of aeration equipment. Generally, in large installations, mechanical-type aerators are favored over diffused air because of greater mixing potential and economy of installing electric lines versus air lines over large distances. The type of equipment to be selected depends heavily on whether the system being designed is based on the aerobic or aerobic-anerobic concept. (See W70-04761). (D-'Arezzo-Texas)
W70-04782

ANAEROBIC TREATMENT OF SOLUBLE WASTES,
Stanford Univ., Calif.
Perry L. McCarty.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 336-352, 6 fig, 3 tab, 35 ref.

Descriptors: *Waste treatment, *Anaerobic conditions, *Design criteria, *Fermentation, *Methane bacteria, *Kinetics (Waste treatment), Bacteria, Biological treatment, Biological communities.
Identifiers: *Anaerobic waste treatment, *Soluble wastes, *Solid retention time (SRT), *Anaerobic process designs, *Anaerobic filter process, Microbiology, Biochemistry, Anaerobic activated sludge process, Anaerobic contact processes.

Anaerobic treatment of soluble wastes has the following advantages over aerobic treatment: (1) high loading rates with little production of biological solids for disposal, (2) lower power requirements, (3) useful production of methane as an end-product. Anaerobic contact processes have been developed, producing more rapid and efficient treatment, and enabling more economical treatment of relatively dilute wastes at ambient temperatures. Efficient anaerobic treatment of soluble wastes with BOD as low as 500 mg/l is now feasible. The best process for diluted waste treatment may be a two-stage operation: (1) anaerobic treatment for waste stabilization, (2) aerobic treatment for effluent polishing. The biological solids rentention time (SRT) is deemed the best parameter of anaerobic treatment control. A minimum SRT exists,-'a breaking point'-below which the critical methane-producing bacteria are removed faster than they can reproduce themselves. With very high SRT values, highly efficient treatment at lower temperatures can be obtained. The 'aerobic filter' appears one of the most promising contact processes for soluble waste treatment, permitting very high SRT's up to 100 days, and affords virtually all major benefits of anaerobic waste treatment process. (See W70-04761). (D'Arezzo-Texas)
W70-04783

NEW DEVELOPMENTS IN ANAEROBIC DIGESTION OF SLUDGES,
Texas Univ., Austin.
Joseph F. Malina, Jr., and Earnest M. Miholits.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 355-379, 10 fig, 5 tab, 38 ref, 3 plates.

Identifiers: *Biochemical reactions, *Anaerobic sludge digestion, *High-rate digestion, *Carter-Pearth gas recirculation systems, 'Shearfusers', Gaslifter digestion system, 'Bubble guns', 'Dynomix' system, 'Densludge' system, 'Aero-Hydraulic' system.

Primary and biological sludge treatment and disposal generated from wastewater treatment present more difficult problems than liquid waste treatment alone. The complexity of biochemical reactions involved in the liquefaction and gasification of wastewater sludges indicates vital need for external and internal control of the reaction variables. Optimum digestion requires solids mixing in a digestion tank by mechanical or gas recirculation methods, within the temperature range of 30 deg-35 deg C. The recommended volatile solids loading is 200 lb/1,000 cu.ft/day, with a detention time of from 10 to 15 days. Digester performance will be improved by maintaining the solids loading and hydraulic displacement as uniform as possible. The various chemical parameters characterizing the digester environment are sensitively interrelated. Therefore, for efficient digestion operations it is essential to determine and evaluate carefully the daily laboratory analyses of volatile acids, the alkalinity, the digestion sludge gases, pH, carbon dioxide production and other critical parameters of the particular wastes being treated. KINETICS OF BIOLOGICAL TREATMENT,
California Univ., Berkeley.
Erman A. Pearson.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 381-393, 3 fig, 2 tab, 7 ref.

Descriptors: *Aeration, *Biological treatment, *Biological properties, Kinetics, Equations (Kinetics), Mathematical models, Oxygen demand, Effluents, Growth rates, Growth stages, Nutrients.
Identifiers: *Extended aeration, *Biological processes, *Michaelis-Menten growth model, *System kinetics, *Kinetic models, Organic substrate removal, Biological process constants, Nutrient removal.

A consistent and rational basis for a kinetic description of both aerobic and anaerobic waste treatment systems is presented. The kinetic model for growth and enzyme substrate removal is based upon that of Michaelis-Menten, and substrate and cell material balance equations including a decay term constitute the basic kinetic descriptions of the process. The need for further laboratory and field determinations of applicable kinetic constants is emphasized. A summary of currently known data on aerobic and anaerobic constants is furnished. The use of kinetic modeling in interpreting biological processes, such as extended aeration is demonstrated. An extended aeration plant is one where the net growth rate is made to approach zero; that is, growth is about equal to decay. An analytical approach to maximum growth processes for application in nutrient removal operations is presented. If aerobic and anaerobic treatment processes are to be evaluated for a specific waste treatment problem on a rational economic feasibility basis, the development of accurate kinetic constants for both processes is vital. (See W70-04761). (D-'Arezzo-Texas)

BASIS FOR WASTE STABILIZATION POND DESIGNS,
Texas Univ., Austin.
Earnest F. Gloyna.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 397-408, 1 fig, 1 tab, 19 ref.

Descriptors: *Waste treatment, *Stabilization, *Ponds, *Design criteria, Facilities, Equations, Aerobic conditions, Anaerobic conditions, Algae, Algal control, Ecological distribution, Activated sludge, Maintenance costs, Construction costs.
Identifiers: *Waste stabilization ponds, *Algal physiology, *Design theory and calculations, Photosynthesis, Illumination, Temperature, Nutrients, Facultative pond designs, BOD, Sludge.

Many problems arising from use of waste stabilization ponds are traceable to inadequate engineering, poor maintenance and lack of operational supervision. However, there is a more fundamental need: Design and engineering for systems using stabilization ponds must be based on an understanding of the principles of algal physiology. Generally, algae growing in a stream or a waste stabilization pond are in a highly competitive environment. One or more of the factors necessary for photosynthesis are interrelated, and unicellular algae, in particular will react rapidly to environmental changes. Illumination, temperature, and nutrients--the factors which affect growth rate are examined critically. The phenomena of algal physiology, together with actual treatment objectives are synthesized in good design. In the final analysis, the specific design of a waste stabilization pond depends heavily upon the specifically-imposed treatment objectives and requirements. A pond system may be designed to receive untreated sewage or industrial wastes, primary or secondary treatment effluents or excess activated sludges and settleable solids. Certain critical factors in design development are discussed, based on operational experiences and research which provide vital insights into environmental factors governing waste stabilization processes. (See W70-04761) (D'Arezzo-Texas)

ADVANCES IN ANAEROBIC POND SYSTEMS DESIGN,
California Univ., Berkeley.
W. J. Oswald.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 409-426, 6 fig, 2 tab, 11 ref.

Descriptors: *Waste treatment, *Stabilization, *Ponds, *Environmental effects, *Biological treatment, *Design criteria, Dissolved oxygen, Temperature, Biochemical Oxygen Demand (BOD), Evaporation, Fermentation, Methane, Algal control, Bacteria, Coliforms.
Identifiers: *Anaerobic waste ponds, *Depth effects, *Hydraulic load effects, *Organic load effects, *Detention time effects, *Faculative ponds, *Aerobic ponds, *Anaerobic ponds, Design for environmental control, Recirculation, BOD removal, Gas production.

The biological actions and interactions in waste stabilization ponds have been complex enough to deter scientific investigation and thus to foster the widespread use of empirical design formulations which are based on limited data. Recognition of the fact that sedimentation and four basic biological reactions interact in ponds, makes possible a rational design of ponds. Precise formulas have not yet been developed governing all variables. However, the relationships between temperature and methane fermentation, depth and temperature, and between depth and oxygenation are well-

established. Methane fermentation is the sine qua non for aerobic and facultative ponds; therefore, designs maximizing temperature uniformity and minimizing oxygen intrusion are most successful. In series ponds, which recycle oxygenated water, the prevention of odor in the initial anaerobic pond is done easily by overlaying the primary anaerobic pond with oxygenated water. For destruction of coliform bacteria, both time and temperature are vital factors. At normal pond temperatures, obtaining time increments by depth increases is easier than getting temperature increments by depth decreases. Wastes having high carbon/nitrogen ratios must be oxidized and aerated before fermentation. (See W70-04761). (D'Arezzo-Texas)

WASTE STABILIZATION POND PRACTICES IN THE UNITED STATES,
Federal Water Pollution Control Administration, Dallas, Tex.
Jerome H. Svore.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 427-434, 2 fig, 2 tab, 8 ref, 1 plate.

Descriptors: *Stabilization, *Ponds, *Design, *Efficiencies, *Chlorination, *Odor, *Waste treatment, Algae, Disinfection, Biochemical Oxygen Demand (BOD), Aeration, Coliforms, Algal control, Dissolved oxygen.
Identifiers: *Aerated lagoons, *Midwest (US), *Southwest (US), *Design criteria, Pond effluent, Colorado, West (US), Stabilization pond loadings, Odor persistence.

The design, operations, and gradual acceptance of waste stabilization ponds in the Southwest during the past 25 years is traced. Recent surveys in Colorado have substantiated general experience in the Midwest, classifying the predominant defects in design, construction, and operation into three classes: (a) liquid depth not maintained, (b) water surface inadequate, and (c) primary solids not evenly distributed. A comparison is made of current methods used throughout the southern half of the United States regarding the excessive algae problem. The determination of lagoon treatment efficiency must be made from the viewpoint of regional water priorities and objectives. The reduction in required chlorine disinfection usage resulting from efficient pond operation is discussed. Some reasons for the trend toward greater use of aerated lagoons are presented. While there are still isolated areas where opinion exists that waste stabilization ponds are dangerous, undesirable and, a health hazard, the major trend is toward recognition that if ponds are designed and operated properly (in series), they will provide more treatment per unit cost than any other single process. (See W70-04761). (D'Arezzo-Texas)
W70-04788

WASTE STABILIZATION POND PRACTICES IN CANADA,
Waterloo Univ. (Ontario).
Charles P. Fisher, W. R. Drynan, and G. L. Van Fleet.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 435-449, 2 fig, 1 tab, 21 ref.

Descriptors: *Stabilization, *Ponds, *Sewage treatment, *Design criteria, *Climatic zones, *Efficiencies, *Odors, Wastewater treatment, Coliforms, Operations.
Identifiers: *Canada, *Prairie provinces, *Northwest territories, *Climatic conditions, Multiple pond requirements, Loading rates.

The waste stabilization pond form of wastewater treatment is gaining acceptance in Canada. The trend is to use this treatment for domestic wastes from large cities. Generally, the efficiency is affected significantly by climatic conditions. Summertime BOD5 removal efficiencies vary between 65% and 90%; winter efficiencies vary between 0% and 55%. Coliform reduction exceeding 99% has been achieved within some ponds. Waste stabilization ponds in the Prairie provinces and in the Northwest Territories, where there are severe winters, are designed for complete winter storage. Elsewhere in Canada ponds are generally continually discharging. Waste stabilization pond treatment systems, consisting of short detention (anaerobic) ponds in series with long detention (facultative) ponds, are also gaining acceptance in the Prairie provinces. Pond organic loading rates vary generally between 10 and 45 lbs. BOD5/acre/day. Odors are commonly associated with the break-up of ice during the springtime on ponds in the Prairie provinces. (See W70-04761). (D'Arezzo-Texas)

EXTRA-DEEP PONDS,
Technion - Israel Inst. of Tech., Haifa; and Water Planning for Israel Ltd., Tel Aviv.
Alberto M. Wachs, and Andre Berend.
Advances in Water Quality Improvement, (Editors Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 450-456, 5 fig, 1 tab, 9 ref.

Descriptors: *Ponds, *Stabilization, *Thermal stratification, *Seasonal, *Sulfides, Temperature, Climatic data, Stratification, Dissolved oxygen, Algae, Biochemical Oxygen Demand (BOD), Mixing, Winds.
Identifiers: *Thermal gradient, *BOD removal, *Israel, *Algal concentration, 'Extra-deep ponds', Ashkelon (Israel), Temperature profiles, Volatile suspended solids, Multi-cell serial system, pH, Facultative pond, Anaerobic pond.

An experimental unit was built by Tahal, Ltd, near the wastewater treatment facility, Ashkelon, Israel, to obtain pilot plant performance data on 'extra-deep' waste stabilization ponds, (i.e., depth greater than 8 feet). The experience gained shows that when loadings acceptable to the Israel climate were used during the warm season, a pronounced thermal gradient caused the upper part of the pond to behave as a 'separate' facultative pond 'floating' on an underlying anaerobic pond. This stratification was enhanced by the fact that both inlet and outlet were located at the surface. Effluent was rich in algae. During the warm season, algal concentrations were much lower at or below depths of 1 meter; therefore, placing of outlet at that depth would draw off better effluent insofar as algal density was concerned, but it was deficient in dissolved oxygen at times. The thermal gradient disappeared during the cold season. Mixing was due mainly to wind action and influenced by pond geometry. Dissolved oxygen was not always present in the upper pond layers but it did contain considerable algae. During fall, a pond turnover occurred resulting in mixing of lower and upper layers. This caused a surface increase of sulfides concentration, a drop in pH, but no odors. During both cold and warm seasons, BOD removal was about 80%. (See W70-04761). (D'Arezzo-Texas)
W70-04790

WASTE STABILIZATION PONDS FOR AGRICULTURAL WASTES,
California Univ., Davis; and Kansas State Univ., Manhattan.
Samuel A. Hart, and Marvin E. Turnet.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 457-463, 2 tab, 6 ref.

Descriptors: *Waste treatment, *Stabilization, *Ponds, *Design criteria, *Anaerobic digestion, Sludge, Disposal, Odors, Mosquitoes, Insect control, Subsurface waters, Infiltration, Biochemical Oxygen Demand (BOD), Chemical Oxygen Demand (COD).
Identifiers: *Agricultural wastes, *Manure stabilization pond, *Livestock manure characteristics, *Pond loading rates, *Pond appearance and location, Sludge digestion, Sludge disposal

In contrast to sewage and other wastewater stabilization ponds, manure disposal ponds are expected to accept very large amounts of organic solid matter, often with scarcely enough water to get the wastes into the pond. The objective is stabilization and disposal of organic matter rather than water purification; effluent is lacking; make-up water is often needed. Biochemical oxygen demand (BOD) loading ranges up to 1200 lbs/acre/day; anaerobic conditions predominate; and are functionally comparable to open unheated sludge lagoons or conventional sludge digesters. Research during the past 5 years confirms dependence on anaerobic processes to stabilize agricultural wastes. Major design criteria are: (1) control odors, (2) control fly and mosquito production, (3) prevent infiltration of pond liquor to subsurface natural waters, (4) proper siting for aesthetic purposes. Other important design considerations relate to: volume and depth criteria, summer sludge upwelling requirements and winter sludge submersion requirements, manure inlet location, sludge build-up rates and removal, pond water levels, effluent runoff control, pond geometry and, plant and insect control. (See W70-04761). (D'Arezzo-Texas)
W70-04791

STABILIZATION PONDS IN THE CANNING INDUSTRY,
Federal Water Pollution Control Administration, Washington, D.C.
Robert A. Canham.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 464-476, 2 fig, 2 tab, 25 ref.

Descriptors: *Stabilization, *Ponds, *Solid wastes, *Separation techniques, *Lagoons, *Odors, Efficiencies, Costs, Design standards, Land, Aeration, Bioindicators, Oxygen demand, Enzymes, Anaerobic digestion.
Identifiers: *Canning industry, *Canning waste, *Sodium nitrates, Odor masking agents, Pure or selected cultures, Biocatalyst additives, Anaerobic-aerobic lagoon treatment, Aerated lagoon, National Canners Association.

The canning industry began at the turn of this century to use the lagoon method for waste treatment. However, the industry regarded this method as disposal rather than treatment, and generally this philosophy still prevails. Early lagoons served essentially as absorption areas providing for wastewater infiltration into subsurface waters, subject to the vagaries of soil conditions and waste properties. Later lagoon types served mainly as seasonal waste storage areas. Increasing odor problems led to widespread practice of using sodium nitrate, but results were unsuccessful due to the cost of nitrates and the consequent reduction in quantities used. Lagoon use declined, as other land methods, such as spray irrigation, were introduced. The combination aerobic-anaerobic system was studied, found effective for treatment, but the odor problem remains. The following methods were tested but found inadequate: innoculations with pure cultures, odor masking agents, biocatalyst additives such as enzymes, and aerated lagoons. Operational variations were tried, but the odor problem remained. A more realistic lagoon design and cost approach is essential to make the lagoon method effective for the canning industry. This means greater cost, more land, more chemicals or aeration. (See W70-04761). (D'Arezzo-Texas)
W70-04792

WASTE TREATMENT IN THE MEAT PROCESSING INDUSTRY,
Carter (Ralph B.) Co., Hackensack, N.J.
A. J. Steffen.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 477-491, 5 fig, 2 tab, 1 pl, 21 ref.

Descriptors: *Waste treatment, *History (Meat processing wastes), *Disposal, *Stabilization, *Pre-treatment (Wastes), *Odors, Anaerobic digestion, Lagoons, Tertiary treatment, Pilot plant, Biochemical Oxygen Demand.
Identifiers: *Meat processing industry, *Waste conservation, *By-product recovery, *Disposal by irrigation, *Stabilization basins or lagoons, *Anaerobic ponds (Pre-treatment), *Modified anaerobic contact process, Aerobic ponds (Complete treatment), Tertiary ponds.

Chemical treatment evoked interest 20-30 years ago, is now limited to pre-treatment achieving only 50-70% BOD removal in current, optimally designed and operated plants. Aerobic treatment such as washable trickling filters have been successful; activated sludge treatment has been effective, but requiring pre-treatment to reduce BOD; aeration systems in concrete tanks and lagoons have been effective for poultry waste treatment; irrigation has been effective for raw meat packing wastes disposal (Illinois and New Zealand) but overall impacts on soil, crops and livestock disease transmission need closer study. Anaerobic ponds are effective as 'roughing' ponds for meat packing wastes because wastes are warm, have high BOD, high organic solid content, and provide proper nutrient balance. Combination aerobic and anaerobic ponds have proved effective. The anaerobic contact process can remove 90-96% BOD in a waste of 1400 mg/l at a digester loading of 0.16 lbs/day/cu. ft, with equalized flow. Digester is a completely mixed system; mixed liquor is degasified by vacuum before gravity separation of sludge which is recirculated to digesters at ratios of 3:1 or 4:1. Process can be closed down on weekends or extended periods without loss of treatment efficiency. By aerobic pond polishing, BOD removal of 80% and suspended solid removal of 88% can be achieved. (See W70-04761). (D-'Arezzo-Texas)
W70-04793

WASTE STABILIZATION POND PRACTICES IN THE PULP AND PAPER INDUSTRY,
Johns Hopkins Univ., Baltimore, Md.; and Louisiana State Univ., Baton Rouge.
Isaiah Gellman, and Herbert F. Berger.
Advances in Water Quality Improvement, (Editors: Gloyna, E. F., and Eckenfelder, W. W., Jr.), Austin, Texas, Univ of Texas Press, 1968. p 492-496, 1 fig, 3 tab, 7 ref.

Descriptors: *Stabilization, *Waste treatment, *Ponds, *Aeration, *Design, *Biochemical Oxygen Demand (BOD), *Odors, Efficiencies, Costs, Construction, Mills, Pilot plants, Retention.
Identifiers: *Waste stabilization ponds, *BOD removal, *BOD loading, *Aerated stabilization ponds, *Pulp and paper industry, Laboratory tests, National Council for Stream Improvement, High-degree effluent treatment, Kraft mills, Chip board mills.

The stabilization pond technique is used predominantly for pulp and paper mill effluents. Data from Southern kraft mill operations indicate that pond design loadings of about 50 lbs of BOD5/acre/day enable at least 85% BOD removal; loadings below 50 lbs provide BOD removals exceeding 90%; increased loadings result in a levelling-off of BOD removals ranging from 60 to 70 lbs/acre/day. Higher BOD removals (up to 150 lbs/acre/day) can be attained using multiple-pond systems; however, high removal operations are accompanied by anaerobic odor production, emission of sulfides, and sulfide oxidizing bacteria. Laboratory and pilot plant studies of aerated stabilization basin process by the National Council for Stream Improvement and its member mills have led to rapid acceptance and extensive application. The aerated basins can remove 40-60 lbs BOD/acre/day, without anaerobic odor production; this correlates well with natural reaeration rates for shallow basins. Construction and operating costs for aerated stabilization pond treatment are about 60% and 40%, respectively, of activated sludge treatment, in the 90% BOD removal range. (See W70-04761). 'BALAS' ALGORITHM FOR ZONED UNIFORM TREATMENT,
Johns Hopkins Univ., Baltimore, Md.
Jon C. Liebman, and David H. Marks.
Journal of the Sanitary Engineering Division, American Society of Civil Engineers, Vol 94, No SA4, Proc Paper 6059, August 1968. p 585-593, 1 fig, 2 tab, 12 ref.

Descriptors: *Mathematical models, *Optimization, *Cost comparisons, *Pollution abatement, *Water quality control, *Water management, *Treatment, Cost analysis, Treatment facilities.
Identifiers: *'Balas' algorithm, *'Zoned uniform treatment', Cost minimization, Delaware Estuary, BOD removal, Uniform treatment, Fortran IV, IBM 7094 computer.

The basic objective of water-quality management is to find the solution to a pollution abatement problem that achieves a specified quality condition in the watercourse in a legally equitable and economically efficient manner. This problem has been approached in various ways; (1) uniform-treatment schemes in which all discharges into streams are given equal treatment; (2) cost-minimization schemes in which mathematical optimization methods are used to achieve desired quality at minimum treatment costs. Optimization schemes have been resisted because they involve individual local inequities in treatment of discharges even though from a regional viewpoint, quality standards and costs are optimal. A compromise concept called, 'zoned uniform,' is suggested. Concept is based on classifying waste discharges into 'uniform zones' (both geographical and categorical in nature) with each waste source given similar treatment to that of similar sources. Total cost is then minimized as long as treatment level is maintained in each zone. An enumeration scheme solution is presented using Delaware Estuary data. (D'Arezzo-Texas)

KINETICS OF ADSORPTION BY ACTIVATED CARBON FROM DILUTE AQUEOUS SOLUTION,
National Institutes of Health, Bethesda, Md.; and Maryland Univ., College Park.
Robert L. Dedrick, and Robert B. Beckmann.
Chemical Engineering Progress Symposium Series No 74, (Physical Adsorption Processes and Principles), Vol 63, 1967. p 68-78, 10 fig, 4 tab, 37 ref.

Descriptors: *Activated carbon, *Adsorption, *Diffusion, *Kinetics, Equilibrium, Isotherms.
Identifiers: *Advanced waste treatment, *Dichlorophenoxyacetic acid, *'Homogeneous diffusion model', *'Pore diffusion model', Concentration, Diffusivity, Intraparticle diffusion.

The removal of small concentrations of dissolved substances from liquids by processes using activated carbon continues to have broad and increasing importance. This study stems from the premise that despite the long history of carbon application, knowledge of kinetics and mechanism of adsorption from liquid solution are incomplete. The two basic mathematical models of intraparticle diffusion kinetics are analyzed: (1) homogeneous diffusion model, (2) pore diffusion model. Tests were made of adsorption of 2-4 dichlorophenoxyacetic acid from dilute solution on carbon such that the rate of transport in the absorbent was controlling, and direct microanalysis of absorbent was made. Authors consider that both models are limiting cases lacking exact precise description of intraparticle diffusion mechanism. The probable mechanism appears to involve both migration of absorbate through the porous carbon with a high energy of activation and diffusion in the adsorbent pores. Surface migration of the homogeneous model appears superimposed on irreversible pore diffusion model effects. (D'Arezzo-Texas)

THE PREVENTION OF WATER POLLUTION WITH SPECIAL REFERENCE TO SOME ASPECTS OF THE TEXTILE INDUSTRY,
Canadian Industries Ltd., Montreal (Quebec).
N. E. Cooke.
Canadian Textile Journal, Vol. 81, p39-44, 1964.

Descriptors: *Water pollution, Water quality.
Identifiers: *Textile mill wastes, *Rayon, *Wool, Sizing, Dyeing, Bleaching.

Tables describe the water quality criteria for (1) drinking water, (2) manufacture of viscose rayon, (3) textile manufacture, (4) support of fish and (5) the objectives of the International Joint Commission for Boundry Waters Quality Control. The sources of biological oxygen demand load in textile mill effluents are (1) impurities in the fibers, (2) sizing and other agents needed for weaving, (3) scouring agents, (4) agents for dyeing, bleaching, and printing, and (5) finishing agents. A table presents the ranges of the five classes as related to the processing of natural and man-made fibers. A second table gives details based on two methods of processing wool, showing that a solvent-based process reduces the biological oxygen demand of the waste to one-ninth of that using the traditional wet scour. Generally accepted methods of treating textile mill wastes are reviewed. The principles used in preventing water pollution by the Millhaven, Ontario and Dalhousie, N.B., plants of Canadian Industries, Ltd., and one example of pollution and aeration from the latter are described. LOW TEMPERATURE ACTIVATED SLUDGE SETTLING,
Alaska Univ., College.
Sherwood C. Reed, and R. Sage Murphy.
Journal of the Sanitary Engineering Division, American Society Civil Engineering, Vol 95, No SA4, Proc Paper 6747, August 1969. p 747-767, 13 fig, 5 tab, 21 ref.

Descriptors: *Activated sludge, *Settling velocity, *Temperature, *Design, Sewage treatment.
Identifiers: *'Zone-settling', *Activated sludge particle, *Sludge-blanket clarifiers, *Thermal protection, *Sludge, Concentration, Particles, Clarification, Fairbanks (Alas), Stokes' Law, BOD.

This investigation is concerned with the temperature influence upon activated sludge sedimentation theory. Particular attention is focused on temperature effects on 'zone' settling velocity. The study is generated by research results in Alaska on aerated

lagoons and sludge processes which indicated apparent high efficiencies requiring minimal thermal protection. Thus, basically conventional treatment plant designs might be economically adaptable to cold weather regions without costly systems thermal protection. This study presents results of a series of settling tests using temperature and concentration as controlled variables. An empirical equation was developed defining the variations of zone settling velocity of activated sludge in terms of concentration, fluid temperature, and organic loading. Temperature effects diminish with increasing concentration. Equation affords rational basis for analysis of design requirements for cold region treatment facilities. Study concludes tentatively that the compression, or thickening, of sludge is independent of fluid temperature. (D'Arezzo-Texas)

LIME CLARIFICATION, RECOVERY, REUSE, AND SLUDGE DEWATERING CHARACTERISTICS,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio. Cincinnati Water Research Lab.
M. C. Mulbarger, E. Grossman, III, R. B. Dean, and O. L. Grant.
Journal Water Pollution Control Federation, Vol 41, No 12, p 2070-2085, December 1969. 11 fig, 5 tab, 28 ref, sample calculations.

Descriptors: *Activated sludge, *Dewatering, *Flocculation, *Lime, Phosphorus, Sludge treatment, Wastewater treatment, Slaking.
Identifiers: *Calcination, *Clarification, *Lime reuse, *Lime recovery, *Secondary effluent, *Experimental system, Recarbonation, Thickening, Vacuum filtration.

This investigation, using typical biologically-stabilized effluents, focuses on studying: (1) the effect of wastewater quality on unit process performance; (2) the possible variations of sludge characteristics as functions of the wastewater treatment system; (3) effects of multiple lime reuse on process performance and calcined sludge quality; (4) possible prediction of required lime makeup and sludge wastage rate before start of operations; (5) possible improvement of lime sludge dewatering properties by addition of flocculants. Specifically, a 75-1 day batch system was used to find effects of secondary effluents and the clarification system on: (1) lime dose; (2) clarification effectiveness; (3) sludge thickening; (4) dewatering characteristics; (5) recalcined sludge quantity and quality. Investigation found that lime reuse did not affect removal efficiency, reuse affected sludge thickening slightly but increased greatly dewatered sludge cake yields. Secondary effluent properties greatly affect system performance and lime sludge characteristics. Sludges produced from mineralized waters having low ratios of magnesium hydroxide/calcium carbonate have superior dewatering properties. Of the four additive flocculants studied, a nonionic flocculant proved most effective; the point of addition affected only slightly the sludge filterability. (D-'Arezzo-Texas)

DEFINED VELOCITY GRADIENT MODEL FLOCCULATOR,
University Coll., London (England).
Francois A. Van Duuren.
Journal of the Sanitary Engineering Division, American Society of Civil Engineers, Vol 94, No SA4, Proc Paper 6076, August 1968. p 671-682, 8 fig, 12 ref.

Descriptors: *Flocculation, *Shear flow, *Laminar flow, Sedimentation, Suspension, Design criteria, Mathematical studies, Bacteria, Hydraulics, Diffusion
Identifiers: *Flocculator, *Velocity gradient, Coaxial cylinders, Ritchie device, Annulus two-dimensional flow, Flow stability, Centripetal acceleration, Theoretical analysis, Design desiderata, Synchronous electric motor, Couette model flocculator.

Orthokinetic flocculation is the most important engineering process in the removal from water of mineral and biological particles up to the size of bacteria. Flocculation is effected by the collision of particles which occurs when velocity gradients exist within a flow. Hence, the study of flocculation requires devices for which shear in the flow can be determined. With this objective, design criteria are outlined and the theoretical basis given for a velocity gradient flocculator. A coaxial cylinder horizontally-mounted, couette device developed is described. The advantage of horizontal mounting of cylinders is to limit sedimentation. This flocculator can be used to apply a desired velocity gradient to particle suspension in order to study various aspects of flocculation. Device behaves properly hydraulically in that it results in a predominantly two-dimensional flow for a wide range of particle coagulant concentrations. The floc-flow patterns observed in flocculation tests with quartzite particles and alum are described. (Shankar-Texas)

PILOT INVESTIGATION OF STARCH-GLUTEN WASTE TREATMENT,
Purdue Univ., Lafayette, Inc.
Joseph T. Ling.
Purdue University, Engineering Bulletin, Extension Series No. 109, p.217-231, 1962.

Descriptors: *Anaerobic digestion, *Lagoons, Solid wastes, Biochemical Oxygen Demand.
Identifiers: *Starch-gluten waste, *Starch-gluten waste treatment, Waste analysis, Protein waste, Starch waste, Carboyhydrate waste, Seeding.

The principal waste involved had a five-day BOD of 12,000 parts per million, consisting of 800 parts per million suspended solids and 15,000 parts per million total solids, of which 14 percent was protein, 7 percent starch, and 79 percent carbohydrate. Of the carbohydrates, 62 percent was reducing sugar. A pilot scale anaerobic digestor was tested during a three-week period. Eighty percent removal of volatile solids was accomplished at a loading of 0.1 lbs. volatile/cu.ft. digestor vol./day. The maximum allowable loading was not reached. Anaerobic lagooning was simulated in 55-gal. drums, and was successful if seeding was included. A minimum of 50 percent removal of volatile solids was observed in seeded lagoons when they were operated at 32-43 deg F. for 11 weeks. The loading applied to the lagoons was 0.022 lbs. volatile solids/cu. ft/day. No objectionable odor was observed in the seeded lagoons within four weeks. Settling of the wastes for 2.5 hrs. was most economical, and this by itself removed 35 percent of the suspended solids. (Livengood-Mattox-North Carolina State Univ)

AMMONIA REMOVAL FROM SECONDARY EFFLUENTS BY SELECTIVE ION EXCHANGE,
Battelle Memorial Inst., Richland, Wash.; and Federal Water Pollution Control Administration, Cincinnati, Ohio.
B. W. Mercer, L. L. Ames, C. J. Touhill, W. J. Van Slyke, and R. B. Dean.
Journal Water Pollution Control Federation, Vol 42, No 2, p R95-R107, Feb 1970. 10 fig, 1 tab, 16 ref.

Descriptors: *Ammonia, *Ion exchange, Resins, *Nitrogen, *Separation techniques, Nitrogen compounds, Effluents, Filtration, Zeolites.
Identifiers: *Clinoptilolite, *Laboratory-scale studies, *Nitrogen inorganic compounds, *Pilot-plant studies, Secondary effluents, Regeneration (Engineering), Removal, Elution curves, Zeolite regeneration process, Mobile demonstration plant.

Removal of ammonia from secondary effluent was demonstrated on a laboratory and pilot scale with a selective ion exchange process. Process uses a natural zeiolite, clinoptilolite, which is selective for ammonium ions in the presence of sodium, magnesium and calcium ions. Regeneration is done with lime solutions, providing hydroxyl ions which react with ammonium ions to yield an alkaline aqueous ammonia solution. The solution is processed through an airstripping tower to remove the ammonia. Spent regenerant is fortified with more lime and recycled. The process does not generate liquid wastes. One cubic foot of granular clinoptilolite regenerated with lime can remove ammonia from more than 2,000 gallons of secondary effluent. Ammonia removals of over 99% were obtained for two columns in series during laboratory experiments. A mobile demonstration plant with a 100,000 gallon per day capacity was constructed. INVESTIGATION OF A WOOD CURING WASTE,
San Jose State Coll., Calif.
Vernon L. Stump, and Franklin J. Agardy.
Journal of the Sanitary Engineering Division, American Society of Civil Engineers, Vol 95, No SA6, Proc Paper 6953, Dec 1969. p 1051-1061, 6 fig, 14 ref.

Descriptors: *Wood-wastes, *Thermo-dri-process, *Industrial wastes, *Wood preservatives, Chemical oxygen demand, Coagulation, Biochemical oxygen demand, Toxicity, Colloids.
Identifiers: *Vacuum chamber, *Oil separator, *Flotation, Reactor unit, Oxidation ponds, Neutralization, Potential biodegradability.

The investigation of the characteristics of a waste produced by an industry should be carried out prior to or, concurrently with, the design and construction of the waste producing facility. Laboratory studies have been made to determine the characteristics and biological treatability of an industrial waste resulting from a new rapid wood curing process referred to as the Thermo-dri-process. Similarly to most wood preserving wastes, there is a much larger chemical oxygen demand (7500 mg/l) than biochemical oxygen demand (2260 mg/l) for the waste associated with the new wood curing process. The BOD/COD ratio is very low with a value of 0.30. The BOD rate constant of the raw waste to the base e is found to be 0.105, indicating poor biodegradability. The organic fraction of the waste is associated mostly with the suspended colloidal matter of the waste, (90%). The BOD determination is difficult and is affected by the size of the sample. The manometric techniques give a more reliable value. Toxicity studies indicate that the waste has a toxic effect as its concentration with respect to bacterial seed increases. Nutrient studies indicate the need for supplementary nutrients such as nitrogen and phosphorus for optimum biological treatment. (Shankar-Texas)

PHOSPHORUS REMOVAL FROM WASTEWATER BY DIRECT DOSING OF ALUMINATE TO A TRICKLING FILTER,
Federal Water Pollution Control Administration, Cincinnati, Ohio.
E. F. Barth, B. N. Jackson, R. F. Lewis, and R. C. Brenner.
Journal Water Pollution Control Federation, Vol 42, No 11, p 1932-1942, Nov 1969. 6 fig, 9 tab, 5 ref.

Descriptors: *Phosphorus, *Trickling filters, *Efficiencies, *Analytical techniques, *Aluminum, *Nitrogen, Wastewater treatment, Filters (Rock), Suspended load, Effluents.
Identifiers: *Operations, *Aluminates, *Chemical removal, *Wastewater characteristics, Secondary sludge, Volatile content, Primary sludge, Digester gas production, Digester supernatant, Dosages, Trickling filter plant.

Trickling filters containing rock media can be dosed with sodium aluminate to increase phosphorus removal efficiency. Filter operation or biological slime on rock media was not affected adversely. Efficiency of the dosed filter for COD, suspended solids and nitrogen removal was similar to that of the control filter. Direct dosing of rock

mineral supplement is not as efficient for phosphorus removal as adding minerals to an activated aeration chamber. Rock media filters short circuit primary effluents without efficient film surface contact thus reducing quantitatively the conversion of complex phosphates to orthophosphates and further affecting the precipitation reaction. Laminar liquid flow over rock is less efficient than turbulent chamber aeration, insofar as aluminum phosphate contact is concerned. Data shows that doses of aluminum to phosphorus above a ratio of 1:1 does not increase phosphorus removal. Once phosphorus has been insolubilized, the removal efficiency depends on particulate matter delivered to the final clarification in settleable form. Approach is not recommended where high phosphorus removal is needed. (D'Arezzo-Texas)

ANAEROBIC DIGESTION TREATS COTTON MILL DE-SIZE WASTES,
A. M. Buswell, and R. S. Ingols.
Wastes Engineering, Vol. 33, No. 8, p402-404, 428, 1962.

Descriptors: *Anaerobic digestion, Chemical oxygen demand, Costs.
Identifiers: *De-sizing, *Starch, Cotton mill wastes, Starch esters, Starch gums, Experimentation.

The de-sizing liquors may provide as much as one-half of the biochemical oxygen demand load and only 10% of the liquid effluent from a textile mill. Therefore it may be advisable to treat this concentrated material separately and this can often best be done by anaerobic digestion. Most of the size removed is starch or starch derivates. Laboratory experiments were made on pure solutions of such materials. About 90% of chemical oxygen demand was destroyed in an aerobic digestion with the gas produced being quite variable as compared with the theoretical yield. A capital cost of $40.00 per pound, per day for digesters was estimated. (Work - North Carolina State University)

NUMBERS AND TYPES OF MICROORGANISMS IN STABILIZATION POND EFFLUENTS,
New Hampshire Univ., Durham.
L. W. Slanetz, T. G. Metcalf, and C. H. Bartley.
New Hampshire Water Resource Research Center Project Completion Report, June 1968, 4 p. OWRR A-007-NH.

Descriptors: *Microorganisms, *Stabilization, *Ponds, *Effluents, Sewage, Coliforms, Streptococcus, Salmonella, Viruses, Bacteria, Organic matter, Indicators, Temperature, Pseudomonas, Seasonal, Water pollution.
Identifiers: Enteric, Survival rates, Flavobacter, Achromobacter, Kurthia, Antibiotics, Health, Indicator bacteria, Stabilization ponds.

Objective was to determine number and type of microorganisms in stabilization pond effluents compared to those present in raw sewage. Numbers and survival of coliforms, fecal coliforms, fecal streptococci, salmonellae, and enteroviruses in raw sewage and in stabilization pond effluents were determined in two community systems, the first containing three ponds and the second, four ponds, both receiving domestic waste. Survival rates for the indicator bacteria from pond effluents were obtained for both systems. Die-off rates were greater in summer than during winter. Salmonellae and enteric viruses were isolated from the majority of effluent samples tested from the first system, and, from the second system, Salmonellae were isolated from 19 out of 33 samples of raw sewage; and enteric viruses from 10 out of 10 Pond 4 effluent samples. The genera Flavobacter, Achromobacter and Pseudomonas were found to be the predominant bacteria that became established and grew in the pond systems. Filtrates from these organisms showed no antibiotic action against coliforms and fecal streptococci. Antibiotic activity against these organisms was demonstrated by the infrequent isolation of bacteria in the genus Kurthia. (Jones-Wisconsin)

TEXTILE WORKS EFFLUENT TREATMENT,
A. H. Little.
Textile Institute and Industries, Vol. 1, p9-11, 1963.

Descriptors: *Legislation, *Cost analysis, *Water pollution control, Pollution abatement, Waste waters, Waste water treatment, Waste disposal, Surface waters.
Identifiers: *Effluent treatment.

The author discusses the effect of recent British legislation concerning pollution on the textile industry, and indicates typical requirements for the discharge of waste waters to municipal sewers and to surface waters. He outlines possible methods of treatment for textile waste waters and indicates some of the costs of treatment and disposal. (Livengood-Mattox, North Carolina State University)

I. FACTORS CAUSING POLLUTION OF RIVERS BY WASTES FROM THE TEXTILE INDUSTRY,
Georgia Inst. of Tech., Atlanta. School of Applied Biology.
Robert S. Ingols.
American Dyestuff Reporter, Vol. 51, No. 10, p 358-359, 1962.

Descriptors: *Biochemical oxidation demand, *Chemical wastes, *Toxidity, *Turbidity, Temperature.
Identifiers: *pH, Sodium hydroxide, Starch, Sizes (Slashing), Carboxymethycellulose.

Pollution is defined as the degradation of water quality as result of mans' use which affects adversely the user of the water downstream. The factors causing pollution include BOD, certain 'inert' organic molecules, high pH values, toxic chemicals, color, turbidity and/or elevated temperatures. (See W70-04849). (Robinson-North Carolina State Univ)
W70-04850

II. THE FEASIBILITY OF TREATING TEXTILE WASTES IN CONNECTION WITH DOMESTIC SEWAGE,
Robert D. Wilroy.
American Dyestuff Reporter, Vol. 51, No. 10, p 360-362, 1962.

Descriptors: *Domestic wastes, *Waste treatment, Trickling filters, Activated sludge.
Identifiers: Bleaching wastes, Starch, Scouring waste.

The trickling filter or activated sludge unit is an aerobic process, and the sludge disgestion process is an anaerobic process. This difference in the processes had a definite bearing on the treatment of the various textile wastes when they are added to a sanitary sewer system. Each waste must be considered in relationship to its characteristics and the relative amount of sanitary wastes for which it can be treated. Pilot-plant studies are generally required with most large volumes to see if the waste can be treated with the sanitary wastes and to develop the necessary design information to do an adequate job. The sewer systems in several cities (Dalton, Georgia; LaGrange, Georgia; Greenville, South Carolina; and Lebanon, Tennessee) which combine textile and industrial wastes are discussed. (See W70-04849). (Robinson-North Carolina State Univ)
W70-04851

III. PROBLEMS OF TEXTILE CHEMICAL WASTES,
Charles Starling.
American Dyestuff Reporter, Vol. 51, No. 10, p 362-363, 1962.

Descriptors: Detergents, Biochemical oxidation demand.
Identifiers: *Biodegradability.

When a waste component exerts a BOD, it is converted to the oxygen equivalent of carbon dioxide, animal protoplasm or vegetable cells, and the problem is through and done when the BOD is satisfied either in a treatment works or in the natural course of the stream travel. When the soluble component of the waste exerts no BOD it stays in its carrier indefinitely. The problem then becomes what concentration of these indestructable wastes can be tolerated in streams and how far are we justified in attempting to solve our waste problems by substituting indestructable materials for those which are destroyed by biochemical oxidation. The best interest of streams are wastes which are 100% biodegradable. The problem of textile chemicals in wastes contains many variables and unknowns. Manufactures of textile chemical specialties should have a primary responsibility in developing new and more biodegradable products. (See W70-04849). (Robinson-North Carolina State Univ)
W70-04852

IV. WASTE WATER CONTROL AND WATER CONSERVATION,
R. Hobart Souther.
American Dyestuff Reporter, Vol. 51, No. 10, p 363-364, 1962.

Descriptors: *Water conservation, Control.
Identifiers: Bio-aeration.

Progress in pollution abatement in the past has been handicapped by the relatively high cost of treatment, due partly to use of outmoded conventional processes. Wet-processing industries in the United States have contributed more in research toward cleaning up streams than governmental agencies. Since capital and operational costs of new types of waste treatment plants are much lower than conventional trickling filter or activated sludge plants, other industrial groups and cities treating industrial waste may be expected to follow with low cost bio-aeration plants. (See W70-04849). (Robinson-North Carolina State Univ)
W70-04853

TREATMENT OF INDUSTRIAL WASTE WATERS IN THE UNITED STATES,
H. H. Black.
Bulletin Mensuel, Centre Belge d'Etude et de Documentation des Eaux, Liege, Belgium, Vol. 34, No. 71, p 246-262, 1956.

Descriptors: *Waste water treatment, Oil wastes, Treatment facilities.
Identifiers: *Textile wastes, Food processing wastes.

Descriptions are given of the treatment in the United States of America of waste waters from oil refineries, motor car manufacture, milk trade, food processing, textile industry. Flow diagrams and photographs of some of the plants are given. (Livengood-North Carolina State Univ)

NITROGEN RELATIONSHIPS IN BIOLOGICAL TREATMENT PROCESSES--I. NITRIFICATION IN THE ACTIVATED SLUDGE PROCESS,
Texas Univ., Austin. Environmental Health Engineering Research Lab.
S. Balakrishnan, and W. W. Eckenfelder.
Water Research (J Int Assn on Wat Pol Res), Vol 3, No 1, pp 73-81, January 1969. 7 fig, 4 tab, 11 ref.

Descriptors: *Nitrification, *Activated sludge, *Organic loading, Aeration.
Identifiers: *C:N ratio, Rate constants, Raw sewage, Mixed liquor, Loading factor, BOD, COD, Kjeldahl nitrogen, Synthetic wastewater, MLSS.

This is the first in a series of three articles. The second is similar to this but on the trickling filter and the third is on denitrification. The authors found complete nitrification when the organic loading factor did not exceed 0.3-0.4, provided the other conditions were optimal. There is a minimum sludge age of 3 to 4 days for good nitrification at 23 deg C. The nitrification increased with an increase in the ammonia applied, but the increase in nitrification was at a slower rate than that for the ammonia. Batch runs indicated that nitrification can be formulated by both the autocatalytic and first order reactions. Complete nitrification of the final effluent is obtained by an aeration period of 8 hrs at a MLSS concentration of 2800 mg/l. Oxygen demand of the mixed liquor ranged within 10 percent of the theoretical requirements for both nitrification and BOD removal. (Ledbetter-Texas)

NEW ZEALAND WOOL SCOURING LIQUORS - TREATMENT AND POTASSIUM RECOVERY,
New Zealand Wool Industries Research Inst., Inc., Dunedin.
J. L. Hoare, R. G. Stewart, and B. J. Sweetman.
New Zealand Journal of Science, Vol. 12, No. 2, p 237-251, 1969. 33 ref, 4 tab, 2 fig.

Descriptors: *Potassium compounds, Domestic wastes, Laboratory tests.
Identifiers: *Wool scouring, *Wool grease, Acid cracking.

Laboratory investigations were made of commercial wool scouring waste liquids to determine the amount of potassium salts present and recover them and also methods of acid cracking to cause wool grease to separate from the water solution. It was concluded that the recovery of potassium salts could not be economically justified. Hard cracking alone produces poor phase separation and the process would require additional chemical or other method of flocculation. It is felt that the most satisfactory method of treatment of wool scouring waste is in conjunction with domestic wastes in conventional sewage treatment plants. (Work-North Carolina State Univ)

WASTE TREATMENT STUDIES AT CLUETT, PEABODY AND COMPANY FINISHING PLANT,
Cluett, Peabody Co., Inc., New York.
R. H. Souther.
American Dyestuff Reporter, Vol. 58, No. 15, p 13-16, 1969. 4 tab, 6 ref.

Descriptors: Hudson River, Biochemical Oxygen Demand, Alkalinity.
Identifiers: *Textile finishing plant, *Mercerizing, *Caustic soda, *Caustic recovery, Mohawk River, Desizing, Scouring, Bleaching, Fabric, Textile mill wastes.

A textile finishing plant, located at the confluence of the Mohawk and Hudson rivers, had potential pollutants resulting from natural impurities on fabrics and from the processing chemicals used in the desizing, scouring, mercerizing, bleaching and finishing operations. Installation of caustic soda recovery units eliminated hydroxyl alkalinity and reduced pollution loading by about 50%. They made it possible to remove 97% of BOD from the effluent water, as compared with about 65% efficiency obtainable with the previous highly alkaline effluent. Tank sizes and retention times in the bio-aeration process were reduced. It was felt that the installation of a filter plant and ion-exchanger would make it possible to recirculate water. (Work-North Carolina State University)

CURRENT PRACTICE IN SOLVENT SCOURING AND ITS FUTURE DEVELOPMENTS,
Tingey-Moss Ltd.
G. I. Hollings, and J. Ruddy.
The Textile Institute and Industry, January 1970, p12-15, 5 tab, 2 fig.
Identifiers: *Dyehouse wastes, *Solvent scouring, Textile mill wastes, Starch, Warp sizes, Sizing wastes.

The use of solvent scouring to replace conventional systems completely eliminates the problem of disposing of highly alkaline wash liquors. A small amount of water is required to remove accumulations of sizing on the equipment, the sizing having been reduced from about 10% to 2 to 4% in the solvent process. Aqueous scouring, following the solvent scouring, may be required to remove those residual amounts of starch sizes from fabrics based upon cotton or cotton blends. (Work-North Carolina State University)

BIOLOGICAL TREATMENT SOLVES DYEWORKS EFFLUENT PROBLEMS,
J. E. Felstead.
Water and Waste Treatment Journal, Vol. 11, p127-129, 1966.

Descriptors: *Activated sludge, Detergents, Biochemical oxygen demand.
Identifiers: *Dyehouse wastes, *Dyes, Nylon.

Treatment facilties were developed for waste waters from the textile dyeing and finishing plant of Joshua Wardle Ltd. at Lee, England. This involved preliminary chemical analyses of minor effluents and laboratory-scale trials on composite effluents. The waste waters were formerly passed over alumina ferric blocks and settled before discharge but the effluent failed to comply with the standards laid down by the Trent River Authority. The waste waters from the 2 mills, in nature mainly organic, but also containing low concentrations of a variety of other compounds such as inorganic salts and bases, are now pumped first to a holding tank, and then to 2 activated-sludge tanks fitted with Simcar aerators. After secondary sedimentation, the final effluent is discharged to the river Churnett, a tributary of the river Dove. (Work-North Carolina State University)
W70-04961

SIMPLIFIED CHEMICAL TREATMENT OF WASTE WATER FROM TEXTILE FACTORIES WITH CLARIFYING, FLOCCULATING, AND PRECIPITATING AGENTS (IN GERMAN),
K. R. Dietrich.
Textil-Praxis, Vol. 22, No. 2, p126-127, 1967. 1 tab, 5 ref.

Descriptors: *Flocculation, Iron compounds, Calcium compounds, Biochemical oxygen demand, *Phosphorus compounds, Chemical precipitation.
Identifiers: *Textile mill wastes, *Precipitation, Silicon compounds, Dyes, Aluminum compounds.

Mixtures of electrolytes containing Al3+, Fe3+, Fe++, Si4+, and Ca++ are more effective flocculating agents than those containing only Fe3+ cations. Applied to textile plant sewage at <50mg./l., the mixtures drastically reduce the organic matter, ppt. or absorb dyes and P compounds, and improve the drying of the sludge; the effects are largely independent of pH. Thus, in 1 case, the treatment reduced the BOD from 215 to 25 mg. 0/1. and the KMnO4 consumption from 1005 to 320 mg./l., while the pH changed from 7.5 to 6.8 and the settling solids from 20 to 175 mg./l. This obviates further pH adjustment, rock filtration, or ion exchange treatment. (Work-Livengood-North Carolina State University)
W70-04962

PROBLEMS OF EFFLUENT DISPOSAL,
Spence (Peter) and Sons Ltd., Widnes (England).
J. H. Harwood.
Textile Manufacturer, Vol. 89, p33-34, 1963.

Descriptors: *Sewers, Sedimentation, Biological treatment, Aeration, Neutralization, Chemical precipitation, Sludge disposal, Filtration.
Identifiers: *Effluent disposal, *Dyehouse wastes, Dyeing wastes, Finishing wastes, Balancing tanks, pH control, Segregation, Screening, Chemical oxidation, Biological oxidation.

The most acceptable solution for industralists is to have their effluent accepted into public sewage systems whenever possible. Costs would be lower than for construction and operation of individual plants. The minimal equipment at a treatment plant consists of balancing tanks, pH adjustment, and sedimentation equipment. If wastes are discharged into streams, biological treatment may also be necessary. Where several types of treatment are carried out on the same site, adequate mixing is essential. Any or all of the following items may be needed: (a) segregation of wastes, (b) balancing and storing, (c) screening, (d) aeration, (e) neutralization, (f) chemical precipitation, (g) chemical oxidation, (h) filtration, (i) biological oxidation, (j) sludge disposal. (Robinson-North Carolina State University)

THE TREATMENT OF STRONG INDUSTRIAL WASTES ON THE CONTINENT,
M. Kehren.
Ciba Review, No 121, p 25-27, 1957.

Descriptors: *Chemical precipitation, *Biological treatment.
Identifiers: Niers process, Sedimentation tanks.

The normal sequence of treatment is a combination of wastes in (a) central sedimentation tank, (b) chemical precipitation followed by settling, (c) biological treatment after waste has passed through a secondary settling tank, and (d) removal of biological sludge in a third settling tank. The Niers process is described. (Robinson-North Carolina State Univ)
W70-04965

FLOCCULATION OF TRADE WASTES WITH IRON COMPOUNDS,
M. Kehren.
Ciba Review, No 121, p 22-24, 1957.

Descriptors: *Chemical precipitation.
Identifiers: *Iron salts, *Ferrous compounds, *Basic dyes, *Acid dyes, *Direct dyes, *Vat dyes, *Sulphur dyes, *Developed dyes, Ferrous sulphate, Ferric chloride, Ferric compounds, Dyehouse wastes.

The approved forms of iron available for application to wastes are as follows: (1) Iron metal turnings and (2) Iron salts (ferrous sulphate, chlorinated copperas, ferric chloride). Systematic treatment of waters containing dyestuffs with iron or iron salts has led to the following conclusions: (1) Treatment with iron salts needs less iron than application of elementary iron. (2) Ferrous compounds are less economical of iron than ferric. (3) With optimum clarifications, divalent iron remains partly unflocculated in the settled liquid and requires after-flocculation. (4) Coagulation is most effective in the pH range of 5.5-6.1. (5) Around the isoelectric point, low concentration of dyestuffs requires relatively large amounts of iron for their removal. (6) In the alkaline range, no clarification occurs if the iron and dye concentrations are between 20 and 100 p.p.m., though considerable iron flocculation takes place. (7) In the strongly acidic range, a given concentration of iron coagulates large amounts of dye, while an increasing proportion of iron remains unflocculated. (8) The dye concentrations most economical of iron range from 100-150 p.p.m. The treatments for basic dyes, acid dyes, direct dyes, vat dyes, sulphur dyes, and developed dyes are described.

TREATMENT OF WOOL SCOURING WASTES WITH COLLOIDAL BENTONITE,
Agricultural Research Service, Albany, Calif. Western Utilization Research and Development Div.
W. Fong, and H. P. Lundgren.
Textile Research Journal, Vol 25, p 994-1000, 1955.

Descriptors: *Bentonile, Chemical oxygen demand.
Identifiers: *Wool, *Wool-scouring wastes, Wool grease, Suint, Scouring wastes, Acid-cracking process, Centrifugal process.

A dispersible-type bentonite produces a marked improvement in the extent of clarification of the waste effluent from the conventional acid cracking of wool. The scouring wastes are acidified with sulfuric acid to a pH level between 3 and 4 and then the required amount of bentonite is added as an aqueous dispersion. The amount of waste between 0.1 and 0.5% is generally sufficient. Treatment of a standard waste with acid and bentonite removed as much as 96% of the grease compared with removal of 67% with acid alone. The chemical oxygen demand was reduced by approximately 60% by the combination treatment, compared with 33% reduction with acid alone. (Work-North Carolina State Univ)

THE PROBLEM OF WASTE WATER TREATMENT,
M. Kehren.
Ciba Review, No 121, p 4-7, 1957.

Descriptors: *Self-purification.
Identifiers: Oxygen depletion.

In biological self-purification, bacteria oxidize or reduce wastes aerobically or anaerobically. Too much load on a stream will upset its recuperative power, and continuous oxygen depletion causes extinction of practically all living matter in water. Photomicrographs of protozoa which oxidize or reduce wastes are included. (Robinson-North Carolina State Univ)
W70-04970

SOME DIFFERENCES BETWEEN BRITISH, AMERICAN, AND CONTINENTAL PRACTICE,
L. Klein.
Ciba Review, No 121, p 3, 1957.

Descriptors: *Biological treatment, *Analytical treatment.

Most of the methods are similar. American industries are more willing to pay for waste treatment. Biological treatment is more common in Great Britain and on the Continent. The small size of British rivers requires a higher degree of treatment. Chemical tests are all similar. (Robinson-North Carolina State Univ)
W70-04971

POLLUTION REDUCTION IN COTTON FINISHING WASTES THROUGH PROCESS CHEMICAL CHANGES,
J. W. Masseli, and M. G. Burford.
Sewage and Industrial Wastes, Vol 26, p 1109-1116, 1954.

Descriptors: *Pollution abatement, *Water pollution sources, Effluents, Biochemical oxygen demand, Soaps, Data collections.
Identifiers: *Cotton finishing wastes, *Substitute chemicals, *Scouring waste, *Desizing wastes, Process chemicals, Starch, Cotton waxes, Pectins, Cellulose ethers.

Results of an effluent survey of a cotton finishing plant were compared with data derived from an inventory of the BOD values of process chemicals used. The former indicated a discharge of 123 pounds and the latter 155 pounds BOD per 1,000 pounds of cloth. Process chemicals were shown to contribute 70-80% of the total BOD with starch, soap, and ACOH the major sources; 20-30% of the BOD was attributed to the natural waxes and pectins extracted from the cotton fiber during scouring. The possibilities are indicated of pollution reductions of 50-75% by substitution of low BOD chemicals for those now used; cellulose ethers for starch. Desizing and scouring contribute 35 and 32% of the total BOD, respectively. (Mattox, Livengood-North Carolina State Univ)

SOME EFFLUENT STUDIES WITH BLEACHING LIQUORS,
Laporte Chemicals Ltd., Luton (England).
L. Chesner, and F. W. Roberts.
Textile Institute and Industry, Vol 1, No 5, p 10-12, 1963. 6 tab.

Descriptors: Biochemical oxygen demand, Domestic wastes.
Identifiers: *Textile mill wastes, *Bleaching plant wastes, *Caustic, Kier processing, Starch desizing, Scouring, Bleaching, Sodium hypochlorite, Cotton, Cotton impurities, Hydrogen peroxide, Peracetic acid, Percolating filters.

Table 1 presents numerical data on the BOD of chemicals used in the textile industry. Table 2 gives the 'population equivalent' per weight of fabric processed. Table 3 presents data for BOD per weight of fabric in selected wet-processing operations. Table 4 analyses waste liquids from caustic scour and bleaching. Table 5 gives the properties of waste water from kiering (scour and bleach). Table 6 is an analysis of effluents from percolating filters processing the waste water in Table 5. The conclusion is made that caustic kier waste water can be purified to the 80-90% level of its first neutralized and if nitrogen is made available either by chemical addition or by mixture with domestic sewage. (Work-NorthCarolina State Univ)
W70-04973

APPLICATION OF CHLORINE AND TREATMENT OF TEXTILES WASTES,
Wallace and Tierman, Inc., Belleville, N.J.
N. S. Chamberlain.
Proceedings of the Third Southern Municipal Industrial Waste Conference, Raleigh, North Carolina, p 176-189, 1954.

Descriptors: Lime, Chlorine, Chemical precipitation.
Identifiers: *Textile mill wastes, *Coagulating, Chemical treatments, Ferrous sulfate, Sulfuric acid.

There is a diversity of waste products from textile mills and therefore, in order to secure coagulation of wastes, the chemistry of these must be known. Batch processes may be preferred, especially where individual chemical wastes can be used to destroy each other. The preferred chemicals to assist coagulation and precipitation of solids are ferrous sulfate, lime and sulfuric acid. Chlorine can be used both for this purpose and to purify effluent waters. PILOT-PLANT TREATMENT IN SEWAGE-TEXTILE WASTE MIXTURES,
Camp, Dresser, and McKee, Boston, Mass.
R. H. Culver.
Journal Boston Society Civil Engineers, Vol 45, p 227-248, 1967. 8 fig, 3 tab.

Descriptors: *Biochemical oxygen demand, Biological treatment, *Trickling filters, Vat dyes, Activated sludge.
Identifiers: *Textile mill wastes.

Before designing a new treatment plant to handle about 11 m.g.d., of which about 40 percent is textile waste, pilot-plant studies were carried out on treatment of the mixed sewage and waste waters by various biological methods. It was concluded that an effluent with a BOD of about 50 mg/l. could be obtained by two-stage biological treatment if the pH value of the influent was reduced to less than 9.5. This can be achieved by treatment with flue gas. First-stage biological treatment on a percolating filter operating with recirculation stabilizes the system and prevents shock loads affecting the subsequent activated-sludge process. The suspended solids in the mixed liquor from the activated-sludge units settle only slowly and coagulation before final sedimentation is necessary to give a well-clarified effluent. About 80 percent of the indigo dye in the waste waters is adsorbed on the biological flocs during treatment. The amount of sludge produced is too small to be used as a source of gas for power production, and therefore the process should be operated so as to produce a minimum quantity of sludge. LEGAL AND PRACTICAL PROBLEMS OF EFFLUENT DISPOSAL,
Spence (Peter) and Sons Ltd., Widnes (England).
J. H. Harwood.
Journal of the Society of Dyers and Colourists, Vol 77, No 11, p 537-543, 1961.

Descriptors: *Legislation, *Sedimentation, Coagulation, Biological ttreatment, Neutralization, Lime, Anaerobic digestion, Sludge treatment.
Identifiers: *Dyehouse wastes, Effluent disposal, Waste treatment plant, Balancing tanks, pH control, Kestner neutralizer, Sedimentation tanks, Aluminum sulphate, Unifloc process, Aluminum lakes, Sodium hypochlorite, Dyes, Textile mill wastes.

The legal position affecting the disposal of trade effluent in sewers, rivers, and estuaries is reviewed. The major portion of the report deals with various treatment processes. The minimum equipment necessary to treat a normal works' effluent consists of balancing tanks and pH adjustment, and sedimentation equipment. The three general types of tanks used are horizontal flow, upward flow, and radial flow. The major types of sedimentation plants are those which use solid reagents, fill-and-draw units, and continuous-flow units. The least expensive method of sludge disposal is to pump the sludge onto the ground and allow it to dry. Many dyes may be decomposed by anaerobic treatment. Paper mill wastes are best disposed of by addition of coagulants before sedimentation. For tannery effluents, chemcial precipitation can reduce the load on biological filters by one-half. Unless the effluent is discharged to a domestic sewer, coagulation is not sufficient. Highly colored dyehouse and textile wastes are successfully treated by formation of aluminum lakes. Soluble dyes can be removed by sodium hypochlorite treatment. (Robinson-North Carolina State Univ)

DEVELOPMENTS AND EQUIPMENT IN EFFLUENT TREATMENT,
J. G. Kennedy
International Dyer, Textile Printer, Bleaches and Finishes, Vol 133, No 12, p 939-947, 1965. 3 diagrams.

Descriptors: *Sewers, Calcium chloride, Waste treatment, Pilot plants, Sludge treatment.
Identifiers: *Wool grease, *Viscose rayon, Fiber production wastes (Synthetics), Textile wastes, Scouring, Biological purification, Physiochemical purification.

One solution to the treatment problem is that industrial wastes may be partially treated before dumping them into municipal sewers, or the wastes may be dumped directly into the sewers. Where a large capital sum is involved or an unknown type of effluent is to be treated, pilot plants are generally erected before embarking on the main scheme. The separation of wool grease by precipitation with calcium chloride is discussed. Methods employed to prevent pollution of the Danube by viscose manufacturing waste are mentioned. An example of the treatment of effluents from a dye manufacturing plant is also given. Two of the newer processes for treatment are the Water Engineering, Ltd., three-stage process which is a complete effluent treatment process suitable for chemical and food industries and stringe discharge filters developed by Stockdale Engineering, Ltd. In summation, the wastes from every plant are different and therefore the type of process chosen depends on the type of waste, amount of waste, and requirements by local authorities. AMMONIA REMOVAL FROM AGRICULTURAL RUNOFF AND SECONDARY EFFLUENTS BY SELECTED ION EXCHANGE.
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.

Available from the Clearinghouse as PB-187 759, $3.00 in paper copy, $0.65 in microfiche. FWPCA, Ohio Basin Region, Robert A. Taft Sanitary Engineering Ctr, Report TWRC-5, March 1969. 58 p. Grant WPRD 26-01.

Descriptors: *Ammonia, *Ion exchange, Calcium, Silicates, Wastewater treatment, *Farm wastes, Nitrogen, *Zeolites.
Identifiers: *Clinoptilolite, Strippers, Ammonia removal.

A selective ion exchange process was developed for removal of ammonia nitrogen from wastewater. The process employs a natural zeolite, clinoptilolite, which is selective for ammonium ions in the presnece of sodium, magnesium, and calcium ions. Regeneration of the exhausted clinoptilolite is accomplished with solutions or slurries containing lime. Lime provides hydroxyl ions which react with the ammonium ions to yield an alkaline aqueous ammonia solution. This ammonia solution is processed through an air stripping tower to remove the ammonia which is exhausted harmlessly to the atmosphere. The spent regenerant is then fortified with more lime and recycled to the zeolite bed to remove more ammonia. Since the regenerant is not discarded, the process generates no liquid wastes. The ion exchange equilibria of four zeolites was investigated and clinoptilolite was selected for further study on the basis of its ammonium ion selectively and low cost. Operation of the mobile plant with secondary effluent resulted in ammonia removals of 97 and 93 percent at 70,000 and 100,000 gallons per day respectively; thus demonstrating that selective ion exchange provides a highly effective means for removing ammonia from wastewater.

5E. Ultimate Disposal of Wastes

DISPOSAL OF BRINE BY SOLAR EVAPORATION: LABORATORY EXPERIMENTS,
New Mexico State Univ., University Park.
C. G. Keyes, Jr., D. C. Winans, C. Morales, H. R. Pritchett, and W. S. Gregory.
Office of Saline Water, Research and Development Progress Report No. 548, April 1970. 152 p. OSW Contract 14-01-0001-969.

Descriptors: *Brine disposal, *Evaporation, *Energy balance, *Evaporation pans, *Laboratory tests.
Identifiers: *Evaporation enhancement, *Dyes.

An experimental study was carried out to determine the effects of wind, temperature, solar radiation, water depth and dyes on the evaporation rate of brine solutions. Naphthol Green dye decreased the evaporation of a 12% brine solution in most cases (depths from 0.25 to 1.5 feet), except at the 1.25 foot depth; i.e., the optimum evaporation depth for the brine with Naphthol Green. It was also observed that evaporation decreased as the concentration increased except around the 12.4% brine level. The upper (17.4%) and lower (0.3%) concentrations produced a different response for temperature and saturation vapor pressure. As radiation increased to a peak value then decreased one value, there was a radiation value which produced a minimum amount of evaporation. This same effect occurred for the saturation vapor pressure and the bulk temperatures.

DISPOSAL OF BRINE BY SOLAR EVAPORATION: DATA,
New Mexico State Univ., University Park.
C. G. Keyes, Jr., N. N. Gunaji, J. V. Lunsford, J. G. Seckler, and O. D. Richard.
Office of Saline Water Research and Develop. Progress Report No. 547, April 1970. 154 p. OSW Contract 14-01-0001-969.

Descriptors: *Brine disposal, *Evaporation, *Energy balance, *Mathematical models, *Computer models, Solar radiation, Heat balance, Heat budget.
Identifiers: *Evaporation rates, Brine evaporation, Theoretical studies.

The disposal of brine by means of solar evaporation has been extensively studied in many arid and semi-arid regions. Efforts to accelerate the evaporation rate have also been made in order to utilize solar methods in areas where the net evaporation is relatively low. The experimental program consisted of studying the effect of Bismark Brown, Congo Red, Methylene Blue, Naphthol Green and Nigrosine Dyes on the solar evaporation of brine. To evaluate the effect of dye on the solar evaporation of brine, three basic methods were employed: (1) Mass Transfer, (2) Energy Budget, and (3) Water Budget. The results of this report consists only of the data furnished to the computer.

DESALTING CALIFORNIA,
California State Dept. of Public Health, Sacramento. Environmental Sanitation Div.
Frank M. Stead.
Environment, Vol 11, No 8, p 2-10, June 1969. 9 p, 5 photo, 1 map.

Descriptors: *Drainage systems, *Drainage water, *Return flow, *Irrigation programs, *California, Diversion loss returns, Water pollution sources, Nutrients, Saline water.
Identifiers: Central Valley (California).

California's Central Valley, one of the most productive farming areas in the world, suffers salt accumulation from irrigation water residues. A master drain is proposed to remove saline irrigation waste water. No safe discharge point can be found. The proposed drain would be the sole drainage outlet for lands soon to be irrigated by the California Aqueduct, and would also serve those presently irrigated lands where excess salt in the soil profile or high water tables currently threaten the production of high crop yields. The central concern is that the

discharge of water from the drain would have a disastrous impact upon the ecology of the San Francisco Bay and the delta systems as a result of nutrients, pesticides and salts in the drainage water. Evaporation, desalination and reuse of waste waters and nutrients are proposed as an alternative to export. (Knapp-USGS)

Identifiers: *Waste disposal wells.

Legislative control of underground waste disposal, the techniques of disposal, and possible effects of the use of disposal wells are reviewed. Few states regulate in any specific way what substances go underground. Many industries and government agencies are taking advantage of this gap in control laws and are now dumping their toxic wastes below the ground through deep injection wells. Such wells are usually cheap to build and operate compared with the cost of cleaning up wastes or storing them, but they offer only temporary safety from the many permanently toxic wastes being injected. The industrial wastes going down deep wells range from steroids and photographic chemicals to uranium tailings. At the Rocky Mountain Arsenal in Denver, wastes from the manufacture of poison gas had been dumped into above-ground holding ponds since 1943. A month after injection began, Denver had its first earthquake in 80 years, and in November 1965, the 710 Denver earthquakes recorded by that time correlated with the volumes of fluid pumped into the Arsenal well. Discontinuation of many wells in service and very careful study of the need and desirability of any new wells are recommended. In general, treatment for nonpolluting surface disposal of industrial wastes is safer and more desirable than underground disposal of raw or dangerous wastes. (Knapp-USGS)

COMPLEMENTARY-COMPETITIVE ASPECTS OF WATER STORAGE (An Engineering-Economic Approach to Evaluate the Extent and Magnitude of the Complementary and Competitive Aspects of Water Storage for Water Quality Control),
Sacramento State Coll., Calif. Dept. of Civil Engineering.
Kenneth D. Kerri.
Available from the Clearinghouse as PB-190 197, $3.00 in paper copy, $0.65 in microfiche. Water Pollution Control Research Series DAST-1, Dec, 1969. 190 p, 6 tab, 10 fig, 37 ref, 5 append. FWPCA Program No. 16090DEA---12/69.

Descriptors: *Allocation, *Flow Augmentation, Marginal analysis, Planning, *Reservoir operation, *Simulation, Temperature control, Water pollution, Water quality.

Allocation of scarce water for flow augmentation to enhance water quality and other beneficial uses conflicts with other water demands. An analytical model is proposed that is capable of allocating water to competing demands on the basis of economic efficiency. The value of water is determined from the slopes of the benefit functions for water uses and an algorithm, based on the theory of marginal analysis, allocates water after considering the complementary and competitive uses of available water. Operations strategies may be selected and revised throughout the demand period regarding the amount of water to remain in storage, or stored and then released for downstream uses or downstream diversions. Results predict the frequency and magnitude of shortages for each beneficial use of water. Simulation of the hydrologic and economic systems of the proposed Holley Reservoir in the Willamette Valley in Oregon was used to test the effectiveness of the proposed analytical model and the results appear very good. A daily streamflow model and a relationship between reservoir operation and recreational attendance were developed to produce an accurate simulation of the basin. Planners, designers, and operations personnel are provided with a method of allocating water in proposed and existing systems. This method indicates the value, extent and magnitude of the complementary and competitive aspects of water storage for water quality control.

MIGRATION OF POLIOVIRUS TYPE 2 IN PERCOLATING WATER THROUGH SELECTED OAHU SOILS,
Hawaii Univ., Honolulu. Water Resources Research Center.
Daniel H. Hori, Nathan C. Burbank, Jr., Reginald H. F. Young, L. Stephen Lau, and Howard W. Klemmer.
Available from the Clearinghouse as PB-190 271, $3.00 in paper copy, $0.65 in microfiche. Technical Report No 36, Hawaii Water Resources Research Center, January 1970. 40 p. OWRR Project A-001-HI.

Descriptors: *Viruses, Groundwater, Water pollution, Absorption, *Leaching, *Percolation.

A laboratory study was made to determine the ability of three Oahu soils, Wahiawa, Lahaina, (both Low Humic Latosols), and Tantalus cinder to prevent possible contamination of the basal-water lens by the passage of virus. The study was performed utilizing columns containing the selected soils and subject to intermittent percolating water containing a known concentration of Poliovirus Type 2, simulating the action of a cesspool leaching into the ground. The effluent from the soil column was collected and analyzed for viral content by the plaque forming techniques. Breakthrough of the virus occurred in both Wahiawa and Lahaina soils at soil thicknesses of 6-inch, 2 1/2 inch, and 1 1/2 inch at applied concentration of 150,000 pfu/ml of feed solution. The virus removal was over 97 percent of the applied titer. The Tantalus cinder proved ineffective in withholding the virus at the applied concentration of 150,000 pfu/ml of feed solution. The virus breakthrough varies between 39 percent to 78 percent of the applied titer.

BOTTOM FAUNA STUDIES OF THE LOWER SABINE RIVER,
North Texas State Univ., Denton. Dept. of Biology.
Albert Hendricks, William M. Parsons, Don Francisco, Kenneth Dickson, and Don Henley.
The Texas Journal of Science, Vol 21, No 2, p 175-187, 1969. 3 fig, 4 tab, 18 ref.

Descriptors: *Benthic fauna, Pulp and paper industry, Environmental effects, Texas, Louisiana, Tidal effects, Hydrogen ion concentration, Oxygen, Stratification, Silts, Sands, Muck soils, Organic matter, Forests, Grasses, Swamps, Snakes, Turtles, Cyanophyta, Conductivity, Insects, Crustaceans, Annelids, Mollusks.
Identifiers: *Lower Sabine River (Texas), Salt water wedge, Hexagenia, Caenis, Dromogomphus, Somatochlora, Aphylla, Telebasis, Hetaerina, Tendipes, Chaoborus, Phylocentropus, Mysis, Gammarus, Sphaeroma, Lumbriculus, Branchiuris, Helobdella, Polymesoda, Uniomerus, Notonecta, Pristina, Mytilopsis, Rhantus, Asellus, Laeonereis.

Bottom fauna inhabiting the Lower Sabine River from Morgan Bluff to the Interstate 10 Bridge over the Sabine River, Texas-Louisiana, were the subject of periodical sampling from the summer of 1965 to spring 1968. The purpose was to determine the biological condition of that portion of the river before and during the time that the Owen-Illinois Paper Manufacturing plant was discharging waste. This report enumerates the organisms found at different stations along the river, their habitats and the particular effects of the environment upon them. All organisms reported were collected before any waste from the paper mill had been discharged into the river, except those collected in the spring of 1968. Dissolved oxygen and temperature varied very little among the sampling stations. It appears that during period of low stream flow, the salt water wedge becomes the primary controlling factor over the bottom dwelling organisms in the stream. Type of substrate material appeared to influence to a certain extent the bottom fauna population. It is proposed that periodic high flows of fresh water are instrumental in flushing out the salt water and repopulating portions of the river. (Jones-Wisconsin)

CONTROL OF SULFATE-REDUCING BACTERIA,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio. Microbiology Section.
Ronald F. Lewis.
Journal American Water Works Association, Vol 57, No 8, p 1011-1016, 1965. 1 tab, 20 ref.

Descriptors: *Bacteria, *Control, *Sulfates, *Reduction (Chemical), Odor, Pipelines, Corrosion, Rusting, Iron, Oxidation, Linings, Sampling, Aeration, Chlorine, Inhibitors, Hydrogen sulfide, Hydrogen ion concentration, Sewage, Nitrogen compounds, Oxidation-reduction potential, Phenols, Copper compounds, Anaerobic.
Identifiers: Tubercle, Desulfovibrio desulfuricans, Reamer, Chromate ion, Cadmium, Zinc, Formaldehyde, Amines.

Although the importance of sulfate-reducing bacteria in the external corrosion of pipelines is well known, their activity inside water mains is often overlooked. Rusty water or offensive odors at isolated points in a distribution system are often attributable to them. A microbiologic investigation was made of tubercles, water mains and the water, confirming that the organism was the specific sulfate-reducing bacterium, Desulfovibrio desulfuricans. This conclusion is consistent with the problem of rusty water accentuated during the warmer months of the year. A series of investigations was conducted to test media and methods for the detection of sulfate-reducing bacteria. Many types of lining compounds have been evaluated and methods of lowering the corrosivity by mechanical or chemical means. Aeration is useful in preventing sulfate-reducing bacterial growth. Tubercles usually form during periods of low oxygen concentration. Maintenance of residual chlorine throughout a distribution system is one of the best preventive measures against the formation of tubercles, which, limited in drinking water supplies, can help prevent corrosion of sewage mains or control odor. (Jones-Wisconsin)

REPORT OF THE SELECT COMMITTEE ON WATER RESOURCES (FLORIDA'S WATER

PROBLEMS).

Florida House of Representatives, Tallahassee, Florida, Oct 1, 1964. 24 p, append.

Descriptors: *Florida, *Legislation, *Water quality, *Water pollution, Standards, Water quality control, Water pollution sources, Administrative agencies, Industrial wastes, Sewage, Sewage treatment, Navigation, Canals, Recreation, Saline water intrusion, Permits, Coasts, Flooding, Flood plains, Drilling, Detergents, Drainage districts, Wells, Water storage.

The Select Committee on Water Resources conducted meetings at various locations around the state in order to familiarize its members with Florida's many water problems. The problems under consideration included: (1) industrial pollution; (2) domestic pollution; (3) deposit of foreign matter in public waters; (4) salt water intrusion; (5) identification and designation of floodplain areas; (6) financing acquisition of water storage lands; (7) licensing of well drillers; (8) hard detergents; and (9) codification of drainage laws. The interest generated at the hearings centered around the general topics of pollution abatement and enforcement and implementation of existing laws. The Committee made various recommendations in each of these areas and proposed legislation to carry out the recommendations. The Committee also suggested that further research be authorized either by a special study group or by an interim committee to report to the next legislature. (See also W70-04882 thru W70-04886). (Dearing-Florida)

REPORT OF THE SELECT COMMITTEE ON WATER RESOURCES (INDUSTRIAL AND DOMESTIC POLLUTION).
Florida House of Representatives, Tallahassee, Florida, Oct 1, 1964, p 6-11.

Descriptors: *Florida, *Industrial wastes, *Domestic wastes, *Water pollution sources, Industries, Chemical wastes, Rivers, Bays, Lakes, Streams, Settling basins, Accidents, Water quality control, Economic impact, Recreation demand, Administrative agencies, Legislation, Sewage treatment, Sewage disposal, Septic tanks, Sanitary engineering, Taxes, Local governments, Sewers.
Identifiers: *Accidental pollution.

Legislatively encouraged industrial expansion and development in Florida has created major problems of disposal of industrial wastes, especially chemical wastes. Substantial quantities of wastes have been accidentally and deliberately emptied into the state's streams, lakes, and bays. There has been some effective local pollution control and several instances of voluntary industrial pollution control. The Committee therefore recommends: (1) major changes in responsibilities of administrative agencies to police industry; (2) adequate staffing or existing enforcement agencies; (3) increased encouragement of industry cooperation; (4) concurrent jurisdiction over water quality control for the Board of Conservation and the Board of Health; and (5) repeal of all local legislation that is inconsistent with the proposed state plan. Domestic pollution is a problem similar in magnitude to industrial pollution. Several municipalities still discharge raw sewage into state waters. Future population expansion will require even more sewage treatment facilities than are presently available. The Committee summarized the findings and recommendations of the Board of Health, and further recommended that any discharge of raw sewage into state waters be prohibited and that regular tax returns be withheld from offending local governments. (See W70-04881). (Dearing-Florida)
W70-04882

REPORT OF THE SELECT COMMITTEE ON WATER RESOURCES (FOREIGN MATTER AND SALT WATER INTRUSION IN PUBLIC WATERS).

Florida House of Representatives, Tallahassee, Florida, Oct 1, 1964, p 12-15.

Descriptors: *Florida, *Domestic wastes, *Saline water intrusion, *Legislation, Navigation, Recreation, Navigable waters, Vessels, Water skiing, Coasts, Water pressure, Drainage, Bays, Canals, Rivers, Dams, Tidal waters, Water wells, Rainfall, Water supply, Administrative agencies, Spillways, Permits, Construction, Public health.
Identifiers: *Saline barrier lines.

Navigation and recreational uses of public waters have suffered from deposits of foreign matter in the waters. Sunken vessels and other debris are unsightly and dangerous to sportsmen and recreationists. The Committee recommends that legislation be passed prohibiting such deposit of any foreign matter into public waters. A further problem affecting water supplies in coastal areas is the intrusion of salt water. The primary factors contributing to this intrusion are: (1) loss of fresh water pressure through increased demands of municipalities, agriculture, and industry; (2) excessive drainage; (3) lack of protective works against tidewaters in bays, canals, and rivers; (4) improper location of water wells; and (5) highly variable annual rainfall with insufficient surface storage during droughts. One method of reducing this intrusion requires the establishing of salt barrier lines along coastal areas. No canals or streams could be constructed or enlarged inland from this line unless structures are installed to prevent salt water from moving inland. The Committee recommends that the Board of Conservation be required to establish these lines and that permits be required before any canal can be constructed or any stream enlarged which would discharge into tidal waters. (See W70-04881). (Dearing-Florida)
W70-04883

REPORT OF THE SELECT COMMITTEE ON WATER RESOURCES, (FLOOD PLAIN AREAS AND WATER STORAGE LANDS).

Florida House of Representatives, Tallahassee, Florida, Oct 1, 1964, p 16-21.

Descriptors: *Florida, *Flood plains, *Water storage, *Legislation, Flooding, Flood protection, Flood forecasting, Flood damage, Flood control, Classification, Administrative agencies, Watersheds, Land use, Government finance, Construction, Water levels, Water supply, Multiple-purpose projects, Construction costs, Project planning, Cost sharing.

There is a need for identification and designation of floodplain areas throughout the state. This would aid prospective land purchasers in selecting property, allow property owners to assess the extent of development that is economically feasible, and aid the landowner in determining the possibility of improvement to prevent or minimize flood damage. The Committee recommends that the Board of Conservation be required to identify and designate such areas which are subject to periodic flooding. The Committee also recommends that adequate funds be secured for the acquisition of water storage lands for several water control projects, especially in the Upper St. Johns River area and the Green Swamp area. Water resources in these areas are being continually diminished and well water levels are being adversely affected. Such water storage areas would help to alleviate this problem and could serve multiple purposes such as recreation and preservation of adequate fresh water supplies. The basic problem in this acquisition of this storage land is the lack of available funds and to this end the Committee recommended several sources for the needed capital. (See W70-04881). (Dearing-Florida)
W70-04884

REPORT OF THE SELECT COMMITTEE ON WATER RESOURCES (WELL DRILLING, HARD DETERGENTS, CODIFICATION OF DRAINAGE LAWS).
Florida House of Representatives, Tallahassee, Florida, Oct 1, 1964, p 22-24

Descriptors: *Florida, *Drilling, *Detergents, *Drainage, Legislation, Permits, Wells, Well regulation, Administrative agencies, Subsurface waters, Water conservation, Local governments, Foaming, Water pollution sources, Industrial production, Alkylbenzene sulfonates, Chemicals, Soaps, Drainage districts, Sewerage, Taxes, Compensation, Rivers.
Identifiers: *Esthetic effects, Hard detergents.

Water waste from improper well construction is a basic conservation problem. To help alleviate this situation the Committee recommends that all well drillers in the state be subject to licensing by a state agency and that the Board of Conservation establish statewide drilling standards adaptable to each county's own particular needs and problems. Another water problem arises from the presence of hard detergents (alkyl benzene sulfonate) in state water supplies as evidenced by the presence of foam in rivers, sewage and water treatment plants. While these detergents present no immediate threat to public health, the esthetic effects they produce are of considerable importance to the state. The detergent industries are responding by substituting some soft detergents for the undesirable hard detergents, but legislation is needed to completely ban the sale of hard detergents within the state. The Committee also recommends revision and recodification of the presently inadequate drainage laws. The proposed revision would give drainage districts authority to construct roadways and water and sewage systems. This revision would also remedy present problems of inadequate organization, procedure, compensation, taxing and bonding powers, and excessive tax penalties. (See W70 04881). (Dearing-Florida)
W70-04885

REPORT OF THE SELECT COMMITTEE ON WATER RESOURCES (PROPOSED STATUTES).

Florida House of Representatives, Tallahassee, Florida, Oct 1, 1964, Appendix.

Descriptors: *Florida, *Legislation, *Water quality, *Water pollution, Water quality control, Standards, Water pollution sources, Administrative agencies, Industrial wastes, Sewage, Sewage treatment, Navigation, Recreation, Saline water intrusion, Permits, Canals, Coasts, Flooding, Flood plains, Drilling, Detergents, Drainage districts, Wells, Water storage.

Based on the foregoing study, the Committee recommends enactment of legislation to: (1) authorize the Conservation Board to establish and enforce water quality standards and to make it unlawful to discharge any pollutants into state waters in violation of the water quality standards; (2) repeal local legislation giving immunity to industrial polluters inconsistent with the proposed water quality control; (3) prohibit the discharge of untreated sewage into state waters; (4) prohibit such discharge of foreign matter into state waters as interferes with navigation and maximum recreational use of public waters; (5) authorize the Conservation Board to establish a state-wide salt water barrier line, and require permits for canal construction or enlargement of natural watercourses in coastal areas; (6) authorize the Conservation Board to identify and designate those areas subject to periodic flooding and considered to be floodplain, swamp, or overflow lands; (7) require the licensing of well drillers, and authorize the Conservation Board to adopt drilling regulations; (8) prohibit the sale, use, manufacture, or possession of hard detergents in Florida; (9) revise drainage district legislation; and (10) appropriate funds for water storage lands especially in the Upper St. Johns River and Green Swamp projects. (See W70-04881) (Dearing-Florida)

OUR NAVIGABLE WATERS -- POLLUTED AND OTHERWISE,
Coast Guard, Washington, D.C. Maritime Pollution Control Branch.
Charles W. Koburger, Jr.
Naval War College Review, p 51-58, October 1969. 1 fig.

Descriptors: *Water pollution control, *Waste water treatment, *Oil, *Accidents, *Federal Government, Water utilization, Coast Guard regulations, Boats, Ships, Disasters, Equipment, Planning.
Identifiers: *National Multi-agency Oil and Hazardous Materials Contingency Plan, *On-scene commander, Spill response, Containment, Countermeasures, Cleanup.

Of interest to laymen, students, and professionals alike, this general survey examines the various aspects of the pollution problem in our navigable waters. Examined also are the measures that can be taken to control it, ashore and afloat. It is concluded that, by wisely employing the measures of control we now have and are acquiring, it should be possible to produce a noticeable improvement in our waterways in the near future. Included are two diagrammatic presentations of the various marine pollution disaster control measures and of their relative sequential priority.

CHEMICAL STABILIZATION OF THE URANIUM TAILINGS AT TUBA CITY, ARIZONA,
Bureau of Mines, Salt Lake City, Utah. Salt Lake City Metallurgy Research Center.
Richard Havens, and Karl C. Dean.
BuMines Rept. of Inv. 7288, August 1969. 12 p.

Descriptors: *Arizona, *Stabilization, Encrustation, *Sealant, Sulfonates, Polymers, Sprinkling, Uranium.
Identifiers: *Erosion control, Slope stabilization, Air pollution, Arid land, *Tuba City.

Acidic and basic uranium leach plant residues located on the Navajo Indian Reservation, Tuba City, Ariz., were successfully stabilized against wind erosion using a relatively low-cost chemical method. An elastomeric polymer chemical was applied to the dike areas and a calcium magnesium lignosulfonate to the beach areas of three tailings ponds. The water-soluble chemicals were applied with an automated sprinkling system. The stabilization cost was $335 per acre for the 34.5-acre tract.

06. WATER RESOURCES PLANNING

6A. Techniques of Planning

AN EVALUATION OF THE DECISION PROCESS IN WATER RESOURCE PROJECT DESIGN,
Stanford Univ., Calif. Dept. of Civil Engineering.
Ray K. Linsley, Stephen J. Burges, and Peter W. Whitford.
Available from the Clearinghouse as PB-190 194, $3.00 in paper copy, $0.65 in microfiche. Stanford, California, Department of Civil Engineering, Technical Report No. 122, Dec. 1969. 76p, 31 fig, 3 tab, 37 ref. OWRR 14-01-0001-1968, OWRR Project C-1321 (1968).

Descriptors: *Decision making, *Planning, Hydrology, Methodology, Reservoir design, Risks, Water utilization, Water supply, Flood control.

Results are presented of exploratory attempts to construct the flow of decisions and data into the design of single purpose water supply and flood control projects. Estimates of uncertainty in each of the data inputs and in each calculation in the analysis were made and a distribution of error in the final project cost or benefit-cost ratio determined. Because of scarcity of data on the magnitude of individual uncertainties most values were estimated on the basis of judgment. The results suggest the possibility of a substantial uncertainty in the ultimate values and indicated that a more thorough investigation of individual components of uncertainty was warrented. The report contains a fairly extensive analysis of the probability characteristics of damage estimates in flood control planning based on the work of James, Benson, and Homan and Waybur. The problem of forecasting water demand for urban requirements is reviewed and some of the problems involved in making these forecasts are discussed. A study was made of hydrologic procedures and their influence on the uncertainty in estimating a required reservoir capacity. The report examines stochastic methods and results obtained suggest that for arid regions very long records of observed streamflow are necessary to properly identify statistical parameters and very long stochastic simulation periods are needed to define a stable distribution of storage requirements.

SYSTEMS SIMULATION FOR REGIONAL ANALYSIS,
Battelle Memorial Inst., Columbus, Ohio; Indiana Univ., Bloomington; Massachusetts Inst. of Tech., Cambridge; and Chicago Univ., Ill.
H. R. Hamilton, S. E. Goldstone, J. W. Milliman, A. L. Pugh, III, AND E. G. Roberts.
Cambridge, Massachusetts, The M.I.T. Press, 1969, 275 p, 57 fig, 52 tab, 1 chart, 158 ref, 4 append.

Descriptors: *Simulation analysis, *Methodology, Computer models, Regional analysis, Computer models, Mathematical models, Management, Decision making, Dynamic programming, Human population, Economic life, Water demand, Water quality, Water supply.
Identifiers: *Susquehanna River Basin, Social sciences, Regional goals, National goals, State of the art, Demographic variables, Employment variables, Water variables.

The book has thirteen chapters. Chapter I introduces the book. Chapter II discusses the problems surrounding model-building research in the social sciences in general and in economics in particular. Chapter III reviews the state of the art in regional economic analysis. Chapter IV compares the Susquehanna model to other regional-economic and river-basin models. Chapter V discusses the philosophy and methodology of approach of the Susquehanna model. Chapter VI describes the methodology for devising economic sub-regions within the basin, and discusses economic and population variables among the sub-regions. Chapter VII gives a brief overview of the model. Chapters VIII-XI discusses individual sectors of the model, the demographic sector, the employment sector, and the water sector. The employment sector takes two chapters: Chapter IX presents the basis for sectoring the employment structure and for identifying endogenous and exogenous forces shaping the regional economy; Chapter X concentrates on export industries. Chapter XII describes several model simulations and suggests model refinements. Chapter XIII summarizes some of the lessons learned during the research. The chapter emphasizes the value of a 'balanced and iterative' research strategy. (See also W70-04836 thru W70-04845). (Gossen-Chicago)
W70-04835

CHAPTER I: INTRODUCTION AND SUMMARY,
Battelle Memorial Inst., Columbus, Ohio; Indiana Univ., Bloomington; Massachusetts Inst. of Tech., Cambridge; and Chicago Univ., Ill.
H. R. Hamilton, S. E. Goldstone, J. W. Milliman, A. L. Pugh, III, and E. B. Roberts.
In: Systems Simulation for Regional Analysis. Cambridge, Massachusetts: The M.I.T. Press, 1969, pp 1-15, 1 fig.

Descriptors: *Simulation analysis, *Methodology, Economics, Computer models, Regional analysis.
Identifiers: *Susquehanna River Basin.

Chapter I is divided into four sections. Section I describes the research problem and how it was approached. The initial problem was to analyze the economy of the Susquehanna River Basin, to define the role of water resources in this economy, and to develop improved techniques for accomplishing this type of analysis. The research program was carried out in three major steps: (1) problem definition and technique selection; (2) model development; and (3) model refinement. The section describes the effectiveness of computer application. It should be used to generate different sets of projections under alternative assumptions regarding data and functional relationships. Section II describes peculiarities of the Susquehanna River Basin economy and of the Susquehanna model. Section III outlines the book. Section IV emphasizes that the Susquehanna model is not a 'general' regional model. Each separate region has a specific set of demands, and so requires an individual model. However, the Susquehanna model represents a significant advancement in the state of the art by typing together the employment, demographic, and water sectors of a large region in one model. (See W70-04835). (Gossen-Chicago)
W70-04836

CHAPTER II: PERSPECTIVES ON MATHEMATICAL MODELS IN THE SOCIAL SCIENCES,
Battelle Memorial Inst., Columbus, Ohio; Indiana Univ., Bloomington; Massachusetts Inst. of Tech., Cambridge; and Chicago Univ., Ill.
H. R. Hamilton, S. E. Goldstone, J. W. Milliman, A. L. Pugh, III, and E. B. Roberts.
In: Systems Simulation for Regional Analysis. Cambridge, Massachusetts: The M.I.T. Press, 1969, pp 16-33, 42 ref.

Descriptors: *Mathematical models, *Economics, Methodology, History.
Identifiers: *Social sciences, Tinbergen, Haavlemo, Cowles Commission, Research.

The purpose of Chapter II is to explicate issues surrounding the role of mathematical models in the social sciences. Section I focuses on social sciences in general. It maintains that the use of mathematical models is a key element in the scientific method, both in the natural sciences and in the social sciences. Issues regarding the appropriateness of mathematical models to the social sciences are discussed. Section II focuses on economics. It outlines a history of the use of mathematical models in economics. Empirically implemented mathematical economic models were a twentieth-century development. The work of Tinbergen, Haavlemo, and the Cowles Commission is described, and criticisms to their work are discussed. Subsequent efforts to resolve these problems are discussed. Results of these efforts include: (1) tremendous growth in the volume and quality of empirical work; (2) a new set of techniques for estimating parameters of models; (3) significant contributions toward the use of models for policy purposes; (4) work on checking the accuracy of forecasts yielded by economic models; and (5) progress in the study of the dynamic properties of economic models. Model building is an important subject that has received little attention. (See W70-04835). (Gossen-Chicago)
W70-04837

CHAPTER III: REGIONAL ECONOMIC ANALYSIS AND RIVER BASIN PLANNING,
Battelle Memorial Inst., Columbus, Ohio; Indiana Univ., Bloomington; Massachusetts Inst. of Tech., Cambridge; and Chicago Univ., Ill.
H. R. Hamilton, S. E. Goldstone, J. W. Milliman, A. L. Pugh, III, and E. B. Roberts.
In: Systems Simulation for Regional Analysis. Cambridge, Massachusetts, The M.I.T. Press, 1969, pp 34-53, 13 ref.

Descriptors: *Economics, *Regional analysis, Income analysis, Computer models, Institutional constraints, Water law, Third party effects, Management, Decision making.
Identifiers: *River basin planning, Regional goals, National goals, Market economy.

Chapter III purposes to show the interrelationships between regional economic analysis and river basin planning. Section I describes the nature of regional analysis. Section II describes the difficulties of regional analysis, most of which arise because theories of regional income generation are insufficiently developed. Difficulties include: defining regions; collecting data; and identifying income generated within a region. Section III discussed three problems of specifying goals for regional planning: (1) many conflicting regional goals may exist; (2) various groups may not agree on the ranking of goals; and (3) regional goals may not reflect optimal development for the nation. Particular goals are related to particular economic models for projecting future economic activity. Section IV addresses problems of relating regional development to the existing institutional framework, and Section V discusses the design of more efficient institutions. The current poor management of water resources has two causes: (1) existing water laws disregard obvious externalities; and (2) the operation of water law prevents development of a market system which might facilitate transfer of water to new uses in response to changing economic relationships. Different regions will require different institutional combinations of centralized decision making and use of the market. (See W70-04835) (Gossen-Chicago)
W70-04838

CHAPTER IV: CONTEMPORARY REGIONAL PROJECTION MODELS,
Battelle Memorial Inst., Columbus, Ohio; Indiana Univ., Bloomington; Massachusetts Inst. of Tech., Cambridge; and Chicago Univ., Ill.
H. R. Hamilton, S. E. Goldstone, J. W. Milliman, A. L. Pugh, III, and E. G. Roberts.
In: Systems Simulation for Regional Analysis. Cambridge, Massachusetts: The M.I.T. Press, 1969, p 54-87, 36 ref.

Descriptors: *Computer models, Economic prediction.
Identifiers: State of the art, New York Metropolitan Region Study, Upper Midwest Economic Study, Ohio River Basin Study, California Development model, Oahu model, Lehigh Basin model, Susquehanna River Basin Studies.

After briefly discussing the general nature of regional economic projections, the chapter discusses six regional models to illustrate the current state of the art. The models discussed are: (1) the New York Metropolitan Region Study; (2) the Upper Midwest Economic Study; (3) the Ohio River Basin Study; (4) the California Development model; (5) the Oahu, Hawaii model; and (6) the Lehigh Basin simulation model. The National Planning Association's study of the Susquehanna River Basin is briefly discussed. These models offer a perspective for discussion of the Battelle Memorial Institute's Susquehanna model in subsequent chapters. There are four major differences between the Susquehanna model and the other models discussed. The Susquehanna model: (1) combines the demographic and economic sectors in one model; (2) is of a simulation type that makes it possible to insert a wide variety of assumptions and parameters and to employ sensitivity analysis; (3) is of a dynamic type, which allows explicit feedbacks and lagged variables within and between sectors; and (4) is the only model to combine the economic and water sectors. (See W70-04835). (Gossen-Chicago)
W70-04839

CHAPTER V: PHILOSOPHY AND METHODOLOGY OF APPROACH,
Battelle Memorial Inst., Columbus, Ohio; Indiana Univ., Bloomington; Massachusetts Inst. of Tech., Cambridge; and Chicago Univ., Ill.
H. R. Hamilton, S. E. Goldstone, J. W. Milliman, A. L. Pugh, III, and E. B. Roberts.
In: Systems Simulation for Regional Analysis. Cambridge, Massachusetts: The M.I.T. Press, 1969, p 88-114, 9 fig, 1 tab, 1 chart, 17 ref.

Descriptors: *Methodology, Regional analysis, Dynamic programming, Simulation analysis, Model studies.
Identifiers: Susquehanna River Basin, Feedback relationships, Continuous simulation, DYNAMO.

Chapter V describes how the general considerations of regional economic analysis and the particular objectives of the Susquehanna study led to the selection of the particular mathematical approach. Problem characteristics arising in regional analysis usually demand methodologies that: (1) contain the capacity to treat a large number of variables; (2) have the flexibility for handling wide variations in data types and functional relationships; (3) are oriented toward dynamic considerations including consideration of time-varying factors; and (4) permit inclusion of feedback relationships. Nonquantitative and quantitative methods of regional analysis are discussed. Simulation methods offer significant advantages: (1) simulation can be inexpensive; (2) minor changes can be easily made; (3) the model is not restricted to linear formations; and (4) the model can contain many variables. Of the three types of simulation, continuous simulation was chosen for the Susquehanna problem because costs were reasonable, numerical methods for approximating simultaneous differential equations were developed, and a computer program, called DYNAMO, was available. The specific methodology has four steps (1) problem definition, (2) model construction; (3) model simulation; and (4) model validation. Each step is fully described. Discussion is illustrated by the step-by-step development of a simply, hypothetical regional model. (See W70-04835). (Gossen-Chicago)
W70-04840

CHAPTER VI: THE REGIONAL SETTING OF THE STUDY,
Battelle Memorial Inst., Columbus, Ohio; Indiana Univ., Bloomington; Massachusetts Inst. of Tech., Cambridge; and Chicago Univ., Ill.
H. R. Hamilton, S. E. Goldstone, J. W. Milliman, A. L. Pugh, III, and E. B. Roberts.
In: Systems Simulation for Regional Analysis. Cambridge, Massachusetts: The M.I.T. Press, 1969, p 115-124, 1 fig, 6 tab, 2 ref.

Descriptors: *Methodology, Regional analysis, Human population, Economic life, Water demand.
Identifiers: *Susquehanna drainage basin, Economic autonomy, Economic development.

Chapter VI describes the Susquehanna River and the economy of its drainage basin. The study area was delimited by the hydrologic entity, regional economic considerations, and data considerations. Because of these factors, the study area selected was composed of whole county units. Division of the area into subregions was necessary for two reasons: (1) the various economics within the study area were developing at grossly different rates; (2) subregionalization was the first step in localizing water needs. Subregions were drawn within the context of defined labor markets and retail and wholesale trading areas. Subregions were selected that minimized commuting from one subregion to another, in order to define subregions with minimum of economic interdependence. There are eight subregions: Elmira; Binghamton; Williamsport; Sunbury; Wilkes-Barre-Scranton; Altoona; Harrisburg; and Baltimore. Each of these includes several counties. The final section of the chapter compares economic and population variables of the subregions. (See W70-04835). (Gossen-Chicago)
W70-04841

CHAPTER VII: AN OVERVIEW OF THE MODEL,
Battelle Memorial Inst., Columbus, Ohio; Indiana Univ., Bloomington; Massachusetts Inst. of Tech., Cambridge; and Chicago Univ., Ill.
H. R. Hamilton, S. E. Goldstone, J. W. Milliman, A. L. Pugh, III, and E. B. Roberts.
In: Systems Simulation for Regional Analysis. Cambridge, Massachusetts: The M.I.T. Press, 1969, p. 125-132, 5 fig.

Descriptors: *Methodology, *Computer models, Human population, Labor supply, Unemployment, Migration patterns, Water quality, Water supply, Regional analysis.
Identifiers: Susquehanna drainage basin, Demographic variables, Employment variables, Water variables, Feedback effects, Low-flow measurement, Model output.

Chapter VII summarizes the model's major sectors. The Susquehanna model contains models of each of the economic subregions. These subregional models are composed of three major sectors: demographic and employment sectors are related by a feedback loop including population, laborforce, unemployment and migration variables. Section I discusses the demographic sector. Three factors--births, deaths, and migration--are involved directly in population change, migration being the most dynamic. In this model, migration ties together the demographic and employment sectors. Section II discusses the employment sector. There

are three employment categories: export industries; wholesalers; and retailers. The driving force of the model is Market Area Demand operating through export industry employment. Section III discusses the water sector. Specific locations with existing or possible water problems were analyzed for quality and quantity with a simple, hydrological low-flow model. The water sector ties together all the subregions, with regard to changes in water quantity and quality. It also tests the potential effects of constructing dams and reservoirs. Section IV briefly discusses model output. General principles for plotting variables are given. (See W70-04835). (Gosseen-Chicago)
W70-04842

CHAPTER XI: THE WATER SECTOR,
Battelle Memorial Inst., Columbus, Ohio; Indiana Univ., Bloomington; Massachusetts Inst. of Tech., Cambridge; and Chicago Univ., Ill.
H. R. Hamilton, S. E. Goldstone, J. W. Milliman, A. L. Pugh, III, and E. B. Roberts.
In: Systems Simulation for Regional Analysis. Cambridge, Massachusetts: The M.I.T. Press, 1969, p 206-233, 8 fig, 4 tab, 19 ref.

Descriptors: *Methodology, *Computer models, Water quality, Water supply, Regional analysis, Simulation analysis, Flood control, Acid mine water, Hydroelectric power, Navigation, Irrigation, Water works, Dissolved oxygen, Recreation, Economic impact, Forest management.
Identifiers: *Susquehanna drainage basin.

The water sector is viewed as a 'technical sector' that is appended to a more general regional simulation model. This sector could be replaced or augmented by other technical factors peculiar to another region. Section I, focusing on methodology, discusses: the separation of the water problem into quality and quantity considerations; the choice of problem areas for analysis; the mechanics of river simulation; and water variables excluded from the model. Water variables excluded are flood control, acid mine drainage, hydropower production, navigation, and irrigation, each of which are discussed. Section II focuses on general water quality and quantity considerations. Use of the water sector allows assessment of important aspects of works construction in relation to dissolved oxygen levels, water quantity, the economic impact of recreation, and the economic impact of the construction of the works themselves. Impact of water on economic development is negligible. Only locations with possible water problems are considered in the model. This approach is practical to study a given basin; it is not intended to provide a general model. Section III discussed forest management to illustrate the dynamics of other kinds of technical sectors. (See W70-04835). (Davis-Chicago)
W70-04843

CHAPTER XIII: IMPLICATIONS OF THE MODEL-BUILDING EFFORT FOR FUTURE RESEARCH,
Battelle Memorial Inst., Columbus, Ohio; Indiana Univ., Bloomington; Massachusetts Inst. of Tech., Cambridge; and Chicago Univ., Ill.
H. R. Hamilton, S. E. Goldstone, J. W. Milliman, A. L. Pugh, III, and E. B. Roberts.
In: Systems Simulation for Regional Analysis. Cambridge, Massachusetts: The M.I.T. Press, 1969, p. 258-275, 1 fig, 7 ref.

Descriptors: *Methodology, Feasibility studies, Model studies, Simulation analysis, Data collections, Statistical models, Mathematics, Dynamic programming, Mathematical models, Data processing, Regional analysis, Computer models.
Identifiers: *Research needs, Susquehanna model, Objectives, Multidisciplinary approach, Iterative research strategy, Alternative methodologies, Operational models, Disaggregation, Public use, Private use.

Section I presents principles which emerged from the Susquehanna regional model-building effort. Planning a model requires clearly stated objectives, a multidisciplinary approach, and an iterative research strategy, which is described extensively. After agreeing on objectives, researchers should undertake an exploratory study to determine the feasibility of the research effort, compare alternative methodologies, and explicate the nature and availability of needed inputs. The second phase involves construction of an initial model. Phase three involves repeated computer simulation testing and reformulating of the initial model. A comparison with other model-building approaches shows that few efforts have employed an interative research strategy. Many models have been built without computer simulation experiments, with too much dependence on one set of data, or with an overemphasis on statistical criteria. Section II summarizes salient features of the Susquehanna model and suggests areas for additional research. The model: (1) is a mathematical model; (2) is an operational model; (3) is data based; (4) provides great detail by disaggregation; (5) incorporates significant advances in formulating the demographic sector; (6) generates outputs relating to water quantity and quality for various points on the river; and (7) illustrates how the computer has affected social scientific research. Section III describes future uses of regional simulation models, including public policy uses and private uses. (See W70-04835). (Gossen-Chicago)
W70-04844

APPENDIX A: THE MANAGEMENT OF A MULTIDISCIPLINARY RESEARCH PROJECT,
Battelle Memorial Inst., Columbus, Ohio; Indiana Univ., Bloomington; Massachusetts Inst. of Tech., Cambridge; and Chicago Univ., Ill.
H. R. Hamilton, S. E. Goldstone, J. W. Milliman, A. L. Pugh, III, and E. B. Roberts.
In: Systems Simulation for Regional Analysis. Cambridge, Massachusetts: The M.I.T. Press, 1969, p. 276-288, 1 fig, 1 ref.

Descriptors: *Personnel management, *Methodology, Project planning, Professional personnel, Scientific personnel, Psychological aspects, Simulation analysis, Model studies.
Identifiers: Multidisciplinary studies, Small projects, Accounting system.

This appendix emphasizes that management is necessary to integrate even highly competent individuals into an effective research team. The management role in multidisciplinary studies is often ignored because small project coordinators usually have less interest in project management per se than in emphasizing their research specialties. In small studies, problems of the project coordinator most often involve personal characteristics of team members. Some must be urged to communicate with other project staff; others must be restrained from overcommunicating. In modeling studies, the major goal should be to study the problem by constructing a balanced model. To do so, the manager must be flexible enough to reassign people among tasks and to alter the research team. A good accounting system is about the only management aid a small-project manager has. He can devise other aids on an ad hoc basis. Because so much research is carried out by small groups, more attention should be given to management of such studies and to providing directors of this research with better tools for achieving high research efficiency. (See W70-04835). (Gossen-Chicago)

WATER RESOURCES SYSTEMS ANALYSIS--AN OVERVIEW,
Battelle Memorial Inst., Columbus, Ohio.
Neil L. Drobny.
American Water Resources Association, Proceedings of the Fourth American Water Resources Conference, November 18-22, 1968. p 534-555, 3 fig, 1 tab, 45 ref.

Descriptors: *Systems analysis, *Methodology, *Decision making, *Mathematical models, Linear programming, Dynamic programming, Stochastic processes, Queueing theory, Simulation analysis, Model studies, Markov processes, Statistical models.
Identifiers: *Policy, Nonlinear programming, Statistical decision theory, Inventory theory.

In the context of this paper, systems analysis refers to a strategy for problem solving which relies heavily on mathematical modeling to assess the technical and economic optimality of alternative system designs, policies and operating procedures for performing various functions and meeting various needs with limited resources. It is important to keep in mind that systems analysis per se does not provide these assessments which also must incorporate professional, legal, political and social considerations. Rather, systems analysis may be employed as a decision aid in assessing the technical and economic consequences of alternative courses of action. Systems analysis techniques have several advantages over traditional methods of design and analysis: (1) systems analysis techniques provide for a more effective union of engineering and economic considerations into the problem formulation and solution procedure; and (2) systems analysis also provides a means for incorporating considerations relating to risk and uncertainty. The following techniques are discussed: (1) optimization programming models; linear programming, nonlinear programming and dynamic programming; (2) stochastic models; statistical decision theory, queueing theory, inventory theory, and markov processes; and (3) simulation models. Limitations on the application of systems analysis to problems in water resources are discussed and viewed as being of two types--data limitations and conceptual limitations. (Davis-Chicago)
W70-04900

WATER SYSTEMS MODELING,
Illinois Univ., Urbana.
Dale D. Meredith.
In: Appendix C of 'Analysis of Water and Water-Related Research Requirements in the Great Lakes Region' Council on Economic Growth, Technology, and Public Policy of the Committee on Institutional Cooperation, June 1968. 17 p, 30 ref, p 61-77.

Descriptors: *Mathematical models, *Model studies, *Great Lakes, Methodology, Great Lakes region, Hydrologic model, Simulation, Systems analysis.

This article maintains that a systems model of the Great Lakes area can be developed. After a thorough review of contemporary attempts at model development, for both systems and subsystems; two basic approaches to a complete system model are discussed, a complete computer simulation and a gaming-situation. The following method in developing a Great Lakes System model is outlined: (1) define questions to be answered by the model, (2) make a 'rough cut' of the model and determine the relevant subsystems to be included, (3) examine the subsystems to determine the areas of the model which are well defined and those which are least well defined, (4) give highest priority for research to those areas of greatest weakness in the model, and (5) maintain a series of working conferences which meet periodically to keep the focus on the overall model and its development. This step is important in that it enables the researchers in the various disciplines to see where their work fits into the model and also to see the kinds of results they need to make their work compatible with the information needed by the model. This model could be modular, so that different sectors could proceed at different rates of development, the critical factor being that the various models must eventually be compatible. The above procedure could be used for either a model of the entire Great Lakes area or for a subregion. (Davis-Chicago)
W70-04901

OPTIMUM WATER USE - A MULTIDISCIPLINARY APPROACH,
North Carolina Univ., Chapel Hill.
Jabbar K. Sherwani.
Multidisciplinary Research As An Aid To Public Policy Formation, Virginia Polytechnic Institute, Blacksbury, p 1-19, December 8 1965. 19 p, 3 ref.

Descriptors: *Optimization, *Water utilization, *Mathematical models, *Simulation analysis, *Input-output analysis, Public benefits, Decision making, Investment, Regional analysis.
Identifiers: Public policy.

Optimum water use in a regional setting was discussed and a multidisciplinary water utilization plan was presented. The plan was based on an optimizing approach to public policy making. Water policy problems were split into two groups: those relating to public investment in water projects and those regulating the decision making process of self-supplied water firms. Optimum water use could not be determined in isolation. Cooperative research between engineers and economists was needed to establish the structural parameters involved in alternative uses which governed the direction of water use. Mathematical models for determining the optimum use of water were recommended. Input-output models, programming techniques, and simulation models were discussed and recommended. It was contended, however, that quantitative models were only indicative of the optimum direction for public policy: necessary but not sufficient. The implementation of these models is in the sphere of the political process. (Thiuri-Cornell)

MARKOV MODELS FOR FLOW REGULATION,
Cornell Univ., Ithaca, N.Y. School of Civil Engineering.
Moshe Gablinger, and Daniel P. Loucks.
Journal of the Hydraulics Division, Proceedings of ASCE, Vol 96, No HY1, p 165-181, January 1970. 17 p, 1 fig, 5 tab, 14 ref, 2 append.

Descriptors: *Markov processes, *Linear programming, *Dynamic programming, *Flow measurement, *Flow control, Reservoirs, Numerical analysis, Efficiencies, Economics, Multiple-purpose reservoirs, Models.
Identifiers: Alternative policies.

The problem of defining alternative operative policies for a single multipurpose reservoir was examined through the use of several pairs of discrete stochastic linear and dynamic programming models. The net flows into the reservoir were assumed to be serially correlated, their probabilistic sequence defined by first order Markov chains. Each linear programming model was shown to correspond to a dynamic programming model. The solutions and computational efficiencies of each of the models were compared using a simplified numerical example based on an actual reservoir operating problem. Although the policies obtained from each pair of corresponding models were identical, the time required to solve the dynamic programming models was less than that required for the linear programming models. However, for reservoir problems that were not too large, it was indicated that it might be more economical to use linear programming. (Thiuri-Cornell)

INTEGRATING REGIONAL WATER AND POWER SYSTEMS,
Harvard Univ., Cambridge, Mass. Harvard Development Advisory Service.
Henry D. Jacoby.
Regional Science Association Papers, Vol 21, p 125-137, November 1967. 13 p, 1 fig, 10 ref.

Descriptors: *Water resources, *Power system operations, *Simulation analysis, *Hydroelectric power, *Decision making, Planning, Investment, Marketing, Computers.
Identifiers: Power interconnections, Models.

A mathematical model was developed and applied to an interconnection of independent regional power utilities. A simulation model was developed to assist in making decisions on investment selections, operating policies, and pricing arrangements. Interconnections between three major cities in Colombia - Bogota, Medellin and Cali - were chosen to illustrate the use of the model. The planning method presented involved the use of digital computer simulation as a tool for analyzing potential investment in generation facilities in each of several electric power markets, for evaluating connections among markets, and for studying alternative schemes for operating such interdependent systems. The model made it possible to analyze a large number of alternative investment schemes and operating policies with relative ease and in a small amount of time. (Thiuri-Cornell)
W70-04988

PROBABILITY THEORY AS AN AID TO RESEARCH PLANNING,
Wisconsin Univ., Madison. Dept. of Civil Engineering.
Paul M. Berthouex.
Journal, Amer Water Works Association, Vol 61, No 12, p 652-658, December 1969. 7 p, 6 fig, 4 tab, 9 ref.

Descriptors: *Probability, *Risks, *Decision making, *Pilot plants, *Design, Technical feasibility, Filtration, Networks, Cost analysis, Economics, Oxidation, Iron.

Probability theory was used to solve a complex network problem and to evaluate various pilot water treatment plant alternatives under uncertainty. The purpose of the pilot water treatment plant study was to reduce technical and economic risks in design, and to provide data useful for scaling up to plants of commercial size. A treatment plant using iron removed by oxidation and rapid sand filtration was used as an example. Network cost analysis was recommended for situations when the probability of getting an acceptable process was low. The probability distribution of obtaining an acceptable outcome was shown for the pilot project example. (Thiuri-Cornell)

DIGITAL SIMULATION TECHNIQUES IN POWER SYSTEM PLANNING,
Norwegian Water Resources and Electricity Board, Oslo.
Vidkunn Hveding.
Economics of Planning, Vol 8, No 1-2, p 118-139, 1968. 22 p, 10 fig.

Descriptors: *Simulation analysis, *Hydroelectric power, *Planning, *Power system operation, *Demand, Storage capacity, Benefits, Efficiencies, Computers, Irrigation, Thermal power, Reservoirs, River systems, Model studies.
Identifiers: Huita-Thjoysa River.

Single plant and multiple plant simulation models were developed for the purpose of planning water reservoirs to provide hydroelectric power. The operational objective was to divide total load at any given moment among the existing units so as to maximize overall efficiency. The planning objective was to provide, in addition to sufficient plant capacity, storage facilities that would maximize total benefits from the system. A demand function for power was developed and various expansion alternatives to meet this demand by a single plant or by multiple plants were compared. The effect of adding a thermal power plant to the hydropower system was applied to the Huita-Thjoysa river system in the operation of the model. It was suggested that the model could also be applied to irrigation allocation problems. (Thiuri-Cornell)

WATER QUALITY AND VALUE OF HOMESITES ON THE ROCKAWAY RIVER, N.J.,
Rutgers - The State Univ., New Brunswick, N.J. Water Resources Research Inst.
Jacquelyn L. Beyer.
Available from the Clearinghouse as PB-190 273, $3.00 in paper copy, $0.65 in microfiche. New Jersey Water Resources Research Institute, Progress Report, Rutgers University, December 1969. 20 p, 2 tab, 1 fig. OWRR Project A-024-NJ.

Descriptors: *Water quality, *Environment, *Environmental effects, Behavior, Social aspects, Economics.
Identifiers: *Residential location desirous, Homesites, Water-based homesites.

The objective of the research was to investigate the probability of finding enough information to warrant an intensive study of the economic effects of water quality upon residential location decisions. The investigation was localized to the Rockaway River area, where water pollution problems are known to have been serious, and considerable local interest in the matter was known to exist. It seems on the basis of this exploratory study that water quality has a relationship to value of homes in the Rockaway River area. Homeowners along clean sections of the river consider its presence an advantage; whereas along polluted sections, homeowners consider the river detrimental. However, there are so many complicating factors that the results obtained are statistically indeterminate. More intensive analysis would be required to separate out the effects of pollution from effects of flood risks, differing economic status of sample populations, extent of knowledge or ignorance of the situation and the constraint imposed by the legal imposition of a freeze upon construction, which tended to raise values of existing homes through scarcity. Guidelines for further research are suggested.

RECOMMENDATIONS FOR WATERSHED RESEARCH PROGRAMS,
William C. Ackermann, Norman H. Crawford, Carl F. Izzard, Max Kohler, and Walter B. Langbein.
Office of Water Resources Research, Report of Panel on Watershed Research, June 1966. 21 p, 21 ref.

Descriptors: *Water resources research act, *Research and development, *Research facilities, Demonstration watersheds, Model studies, Hydraulic models, Mathematical models, Urbanization, Grants, Laboratories, Planning.
Identifiers: Water resources research.

An advisory report on watershed research is presented, covering the following subject areas: (a) The principal subject-matter and geographic areas of watershed research for which previous work has already provided substantially adequate knowledge; (b) watershed research subjects or techniques which past work indicates are not likely now to yield results sufficient to justify additional substantial research effort; (c) watershed research subjects that now appear promising areas for increased emphasis; and (d) recommendations as to measures under the Water Resources Research Act that might aid in bringing about needed increases of research. The panel recommendations for consideration of OWRR in administering programs under P.L. 88-379 cover watershed research on: experimental watersheds, representative watersheds, physical models, mathematical models, and effects of urbanization. Mathematical modeling of watershed behavior is a fruitful field of study. Greater emphasis on the subject of effects of urbanization is recommended. (Knapp-USGS)

THE DELAWARE RIVER BASIN COMMISSION, A PROTOTYPE IN RIVER BASIN DEVELOPMENT,
Delaware River Basin Commission, Washington, D.C.
Vernon D. Northrop.
Journal of Soil and Water Conservation, Vol. 22, No. 2, Reprint, March-April 1967, 4p., 2 photo, 1 ref.

Descriptors: *Interstate commissions, Water supply, Water pollution.
Identifiers: *Delaware River Basin Commission, Clean Water Restoration Act.

The water crisis of the last third of the 20th century includes a tripling of water supply needs by the year 2000, an inadequate water supply, and the need of between $40 billion to $100 billion to win the fight against water pollution. The article discusses the development of a federal-interstate compact organization as a mechanism for dealing more effectively with the water problems. The characteristics and importance of the Delaware River are presented along with a discussion of two previous compact plans. Four states, New York, Pennsylvania, New Jersey and Delaware, organized the Delaware River Basin Advisory Committee. This Committee developed a federal-interstate compact, developed the type of organizational approach for the Delaware basin, and drafted the terms of the compact and obtained support for its enactment. The resulting federal-interstate agency has proven to be an effective organization; it is responsible for the Clean Water Restoration Act. Fears of conflicts of interest have been unfounded. (Grossman-Rutgers)

THE DISCOUNT RATE IN PUBLIC INVESTMENT EVALUATION - VIEWS FROM THE FEDERAL GOVERNMENT: A PANEL DISCUSSION,
Soil Conservation Service, Washington, D.C.
Charles F. Lemon.
Conf. Proc., Comm. on the Econ. of Water Resources Develop., Denver, Colo., p. 91-97, Dec. 17-18, 1968. 7p., 1 tab.

Descriptors: *Discount rate, *Small watersheds, Federal government, Interstate.
Identifiers: Water Resources Council.

The implications of various discount rates on water resource projects under the small watershed program, as administered by the Soil Conservation Service, are described. First a historical background of the small watershed program is presented. Then the discount rate as proposed by the Water Resources Council is presented. This discount rate is based on the interest rate on the average yield during the preceding fiscal year on the interest-bearing marketable securities of the United States. This formula leads to a higher rate. Its effect is demonstrated by an analysis of the watershed project in the Ozark region of Arkansas. A table is presented which indicates the effect of using the higher interest rate of 4 5/8 percent for benefit-cost evaluation. (Grossman-Rutgers)

THE DISCOUNT RATE IN PUBLIC INVESTMENT EVALUATION - VIEWS FROM THE FEDERAL GOVERNMENT: A PANEL DISCUSSION,
Water Resources Council, Washington, D.C.
Harry A. Steele.
Conf. Proc., Comm. on the Econ. of Water Resources Develop., Denver, Colo., 83-85, Dec. 17-18, 1968. 3p, 1 graph.

Descriptors: *Discount rate, Interest rate, Water Resources Planning Act, Economic efficiency, Federal government.
Identifiers: Coupon rate, Government bonds, Water Resources Council.

The difference between discount rates based on the opportunity costs in private market and that based on social time preference is so great that the method chosen will drastically change the formulation of water resources plans. Therefore, the choice of the discount rate will affect many policy objectives and economic efficiency. Under the Senate Document 97 the yield rate on long-term government bonds (i.e., coupon rate) was used as the discount rate. In July of 1968, the Water Resources Council proposed a formula which would start at 4 5/8 percent and change with the average yield on long-term bonds of the preceding year but not more than one percentage point in any one year. A later proposal would be a discount rate starting at 4 5/8 percent and would use a 5-year moving average, but limiting yearly changes to 1/4 of a percentage point. A task force and natural and regional hearings are intended to improve procedures in determining the discount rate and planning policies. A graph illustrating the second discount rate proposal overtime is given. (Grossman-Rutgers)
W70-04826

THE DISCOUNT RATE IN PUBLIC INVESTMENT EVALUATION-VIEWS FROM THE FEDERAL GOVERNMENT: A PANEL DISCUSSION,
Office of the Chief of Engineers (Army), Washington, D.C. Civil Works Directorate.
B. J. Tofani.
Conf. Proc., Comm. on the Econ. of Water Resources Develop., Denver, Colo., pp. 99-101, Dec. 17-18, 1968. 3 p.

Descriptors: *Discount rate, *Resource development, Federal Government.
Identifiers: Water Resources Council, Corps of Engineers.

The effect of a higher discount rate is found within the scope of individual projects. Under the higher rate the increments of projects will be found unjustified, therefore projects will end up smaller. Also, other projects will be restricted due to the higher rate. The magnitude of construction under the Corps of Engineers' program is not directly affected by the discount rate for the primary constraint of the program is the funding level. Under the higher discount rate in project evaluation, lesser weight is given to future benefits in comparison to near-term benefits. A brief history of the role of the Federal Government in water resources is presented. Its role in water resources development is found to be a complicated one. (Grossman-Rutgers)
W70-04827

THE DISCOUNT RATE IN PUBLIC INVESTMENT EVALUATION - VIEWS FROM THE FEDERAL GOVERNMENT: A PANEL DISCUSSION,
Committee on Appropriations (U.S. Senate).
Kenneth J. Bousquet.
Conf. Proc., Comm. on the Econ. of Water Resources Develop., Denver, Colo., pp 103-106, Dec. 17-18, 1968. 4p.

Descriptors: *Discount rate, Resources development, Cost-benefit analysis.
Identifiers: *Senate Subcommittee on Economy in Government, Water Resources Council.

The increase in the discount rate from 3 1/4 percent as set forth in Senate Document 97 to 4 5/8 percent as proposed by the Water Resources Council is a 42 percent increase. It is suggested that a stepped increase occur to allow time for the development of better techniques of project benefits. In the field of water resources development benefit-to-cost analyses are made to determine if the objective of the project is to be met. An example of the type of analysis that follows from recommendations of the Senate Subcommittee on Economy in Government as applied to a business is presented. The example cited shows that a higher discount rate decreases the apparent desirability of

projects where the benefits increase over the life of the project than those where the early returns are high. A high proportion of early returns usually means a less than optimum size project. (Grossman-Rutgers)

THE VALUE OF RESERVOIR RECREATION,
Cornell Univ., Ithaca, N.Y. Dept. of Agricultural Economics.
Jeff Romm.
Cornell University Water Resources and Marine Sciences Center, Technical Report No. 19, Aug. 1969, 102p, 19 fig, 24 tab, 15 ref.

Descriptors: *Recreation, *Reservoirs, *Public benefits, Cost-benefit analysis, Recreation demand, Estimating.
Identifiers: *Whitney Point Reservoir, *Recreation benefit estimating.

This study compares several techniques of estimating and benefits of reservoir recreation. A survey was taken at Whitney Point Reservoir, Broome County, New York; the results were used as sources of data for this study. The survey methodology is discussed, and the purposes of recreation benefit estimating and demand estimation techniques are examined. Then the following techniques are explained and examined: The Clawson Approach, Consumer Surplus Approach, Willingness to Pay, Government Payment, Consumers Preference Approach, Social Preference, and Requirements Approach. The results for the different estimation techniques are summarized. Finally, public needs and administrative goals are examined and a conclusion is included. (Grossman-Rutgers)

ALTERNATIVE INSTITUTIONAL ARRANGEMENTS FOR MANAGING RIVER BASIN OPERATIONS.
Water Resources Council, Washington, D.C.

Washington, D.C.: Water Resources Council, August 1967, 8 p.

Descriptors: *Management, *Administration, *Planning, *Institutions, *River basins, Institutional constraints, Interstate compacts, Interstate commissions, River basin commissions.
Identifiers: *River basin management.

The report reviews eight types of management arrangements: (1) the interstate compact; (2) the federal interstate compact; (3) river basin commissions; (4) basin inter-agency committees; (5) regional federal-state commissions; (6) intra-state special districts; (7) the federal regional agency; and (8) the single federal administration. Each was analyzed to determine its effectiveness, capabilities and limitations in performing the following principal functions: (1) regulation; (2) construction; (3) financial capability; (4) operation; (5) comprehensive river basin planning; (6) evolution and amendment; and (7) ability to obtain cooperation. It is concluded that the following three types can be useful instruments in appropriate circumstances and under appropriate terms and conditions in the management of river basin resources: interstate compacts, federal-interstate compacts, and separate federal and state institutions assisted by joint federal-state planning bodies. The report recognizes that no one institution can be said to be the best for all situations and recommends that normally, before a new institutional arrangement is established in any basin, the needs of the basin should be determined and the major outlines of a basic comprehensive plan for the conservation, development, and management of the basin should be clearly seen. MAN AND HIS URBAN ENVIRONMENT,
North Carolina Univ., Chapel Hill. School of Public Health.
Daniel A. Okun, and Stanley J. Weidenkopf.
Dept of Environmental Sciences and Engineering Publication No. 207. Presented at the Regional Conference on Improving the Physical Environment of the South, Co-sponsored by the Southern Conference of the Council on State Governments and the Agricultural Policy Institute, Atlanta, Georgia, 16-17 December, 1968, 21p, 28 ref.

Descriptors: *Environment, Social aspects, Environmental effects, Political aspects, Planning, Standards.
Identifiers: *Urban environment, *Resource reutilization, *Comprehensive environmental planning.

Focusing on the existing degradation of the environment, this paper stresses that man not only contaminates his environment, but is to a large degree the designer of his environment. After a short historical survey, the need for the reutilization of resources is stated. Several elements of the urban environment are discussed in detail including: the urban population problem, the physical environment, the social environment, and the development of environmental standards. A number of requirements for solving the problems of the urban environment are described. The first and most important requirement is an enlightened and aroused public which clearly recognizes the problem. A second requirement is a responsive political structure. A third requirement is an adequately organized and supported scientific community to determine the effect of environment on man, and man's ability to adopt to environmental changes, to establish acceptable limits, to develop effective and economical control procedures; and to educate and train future scientists for research, teaching and practice. Fourth, comprehensive environmental planning must be utilized. Finally, the implementation of planning and control programs through participation of industry, the professions, voluntary citizen's organizations and local government is essential in the formation of effective programs of environmental control. (Davis-Chicago)

ENVIRONMENTAL PLANNING WITH SPECIAL RELATIONS TO NATURAL RESOURCES,
North Carolina Univ., Chapel Hill. School of Public Health.
Maynard M. Hufschmidt.
University of North Carolina, School of Public Health, Department of Environmental Sciences and Engineering, Publication No 192, July, 1966, 33 p, 34 ref.

Descriptors: *Planning, *Management, *Environment, *Natural resources, *Methodology, Decision making, Public health, Aesthetics, National income, Economics.
Identifiers: *Comprehensive environmental planning, *Public investment decision model.

The concept of comprehensive environmental planning included as managing the air space, the water-resource and the land-space, in terms both of handling pollution and wastes, and of urban design. Three fundamental issues are raised. First, what are the underlying goals or objectives of comprehensive environmental planning. Second, who are the environmental planners, or who should they be. Third, what planning theories, processes and techniques are appropriate. Three goals or objectives were identified: (1) physical and mental health, (2) aesthetics, and (3) national income (or regional or class income). Three groups have assumed the role of environmental planners in the past; environmental scientists, environmental designers and social scientists. However, the task must be shared by all in the application of social science theory and technique to environmental problems, through combined research by the three groups mentioned above. The final issue is addressed by the suggestion that the public investment decision model be adopted, and that the problems of environmental planning be examined in terms of this model. The application of this model is discussed considering various approaches: standards, multiple standards-classification, safe minimum standard, system optimization, economic efficiency, and multiple objectives. Several methodological problems are discussed as well: (1) definition of the production function; (2) the cost-input function; (3) derivation of the benefit-output function; and (4) the objective function. (Davis-Chicago)

MANAGING THE GREAT LAKES WATER RESOURCE,
North Carolina Univ., Chapel Hill. School of Public Health.
Daniel A. Okun.
Dept. of Environmental Sciences and Engineering, Publication No 195. For presentation at the Annual Conference of the Water Pollution Control Federation, Chicago, Illinois, September 24, 1968, 8 p, 6 ref.

Descriptors: *Management, *Water resources, *Great Lakes, Lakes, Water pollution, Water quality, Water pollution control, Diversion, Water reuse.
Identifiers: *Hierarchy of water quality, Chicago (Ill).

The Great Lakes constitute the largest fresh water resource in the world. Because there are no large

rivers that drain into the Great Lakes Basin, and because the intensity of development is expected to accelerate due to urban growth, the urgency for sound management of this water resource is clear. Changes in water quality in the Great Lakes have tended to deteriorate, especially in the lower lakes. A steady increase in the concentration of chemicals indicative of increased man-made pollution has been identified. Two proposals for improving the quality of water in the Great Lakes can be explored. First, large scale improvement of water quality can be obtained through the diversion of effluents to other water bodies. The classic example is the City of Chicago whose wastewater is diverted into the Mississippi River system. Second, a hierarchy of water quality could be adopted. Much of the water needs in the Great Lakes Basin could be served by reclaimed wastewaters. In addition, the reclaiming process would serve to improve the quality of the initial effluents. (Davis-Chicago)

BACKGROUND MATERIAL COVERING THE FEASIBILITY OF CREATING ISLANDS IN LAKE MICHIGAN NEAR CHICAGO,
Raleigh Spinks.
Chicago City Planning Department, January 1961. 63 p, 7 fig, 39 ref.

Descriptors: *Lake Michigan, *City planning, *Islands, Urbanization, Planning, Attitudes, Social aspects.
Identifiers: *Chicago, *Policy making.

This paper attempts to provide background material relating to the creation of offshore islands in Lake Michigan near Chicago. Four main areas are covered: (1) Local planning considerations, where the concept of whether islands are a good idea in light of the Chicago Comprehensive Plan and where conflicting existing and proposed developments, conflicting public and private interests, and local approvals required are examined; (2) government policies and regulations are examined at different levels that govern the use of lake land; (3) engineering aspects of design and cost are analyzed; and (4) existing and proposed island projects in the Chicago region are described. It is the major conclusion of this paper that there appears to be no governmental, engineering or financial facts that would hold back the realistic development of islands in the lake. It appears that under the right circumstances, the free market would allow the islands to be built on a competitive basis. The major drawback appears to be the gap between what is technically feasible from an engineering and financial viewpoint and what is acceptable by the public, or understood by the public. In conclusion, preliminary research indicates that the question of islands in the lake is a city planning 'policy and values' problem rather than an engineering or financial problem. (Davis-Chicago)

NATIONAL POLICY PROBLEMS IN WATER RESOURCES.
American Society of Civil Engineers. Washington, D.C. National Capitol Section.

Available from Dean C. Pappas, Secretary, National Capitol Section, ASCE, c/o Board of Engineers for Rivers and Harbors, Second and Q Sts, S.W., Washington, D.C. Proceedings of Spring 1968 Water Resources Conference, Catholic University, Washington, D.C., May 11, 1968. American Society of Civil Engineers, National Capitol Section, Washington, D.C., 1969. 42 p.

Descriptors: *Evaluation, *Water policy, *Cost sharing, *Social needs, *Water resources planning act, Benefits, Federal project policy, Formulation, Future planning, Institutions, Water resources development, Cost repayment, Social values, Cost-benefit analysis, Economic efficiency.
Identifiers: *Planning objectives, Economic development, Regional development, Environmental quality.

The theme of the conference was on national policy problems. The interdisciplinary approach to these problems was emphasized by the physical, economic, financial, ecologic, sociologic, and political interrelationships discussed. Major topics dealt with water resources development in the context of total social needs, cost sharing and repayment, the viability of current institution, evaluation of outputs, future planning, and changes needed in national water policies. Principal speakers were Senator Frank E. Moss, Theodore M. Schad, Burnham H. Dodge, James J. Flannery, Philip M. Glick, Charles Howe, Lyle E. Craine, and John D. Whisman. The Conference was sponsored by the Water Resources Committee, National Capitol Section, ASCE, at the Catholic University, Washington, D.C. on May 11, 1968. (Blanchard-ASCE)

EVALUATION OF RESOURCE USE AND ECONOMIC EFFECTS DUE TO IRRIGATION WATER AVAILABILITY IN TEXAS,
Texas A and M Univ., College Station. Water Resources Inst.
Warren L. Trock.
Available from the Clearinghouse as PB-190 361, $3.00 in paper copy, $0.65 in microfiche. Technical Report No 22, Water Resources Institute, Texas A and M University, August 1969. 76 p, 27 tab, 3 fig, 48 ref. OWRR Project B-005-TEX.

Descriptors: *Irrigation, *Economic impact, *Evaluation, Water development, Water supply, Resource economics, Optimum resource use, Linear programming.

Estimation of the effects on agriculture of alternative levels of water development in Texas was accomplished in this study. Use of land and water resources in crop production with variable total supplies of irrigation water was projected to 1980, 2000, and 2020. Constraints on output were established as Texas' shares of U.S. food and fiber requirements. Constraints on water supplies were developed by state water planners. It was concluded that without further water development, irrigated acreage in Texas would decline over time and Texas' shares of some U.S. good requirements would diminish.

THE EVALUATION OF RISK IN MARINE CAPITAL INVESTMENTS,
Robert F. Klausner.
Engineering Economist, Vol 14, No 4, p 183-214, July-August 1969. 32 p, 4 fig, 3 tab, 11 ref.

Descriptors: *Risks, *Mathematical models, *Simulation analysis, *Capital, *Investment, Return (Monetary), Decision making, Probability, Economic justification.
Identifiers: Cash flow.

Mathematical models for solving problems of uncertainty and risk in the evaluation of capital investment opportunities were discussed. Traditionally used techniques were found to be deficient because they did not provide an overall indicator of outcome variability or a consistent framework for analysis. They therefore resulted in a qualitative 'feel' rather than a quantitative assessment of risk. The Probabilistic Cash Flow Simulation technique was recommended over the simple Discounted Cash Flow analysis technique. In addition to indicating the discounted cash flow return, the method also showed the probability associated with realizing the investor's minimum acceptable return. The Probabilistic Cash Flow Simulation technique thus provided the decision-maker with the risk return information necessary for him to establish an investment's economic desirability. It was suggested that the technique would prove valuable in the evaluation of future marine capital investments. (Thiuri-Cornell)

THE DISCOUNT RATE IN PUBLIC INVESTMENT EVALUATION; PART I. VIEWS FROM THE ACADEMY.
Western Agricultural Economics Research Council, Denver, Colo. Committee on the Economics of Water Resources Development.

Water Resources and Economic Development of the West, Report 17: Discount Rate in Public Investment Evaluation, Part I: Views from the Academy. p 1-82, 1968. 21 tab, 1 fig, append.

Descriptors: *Water resources development, *Discount rate, *Decision making, *Project planning, *Investment, Arid lands, Federal government, Water policy, Interest rate, Budgeting, Economic justification, Economics, Planning, Programs, Social aspects, Social values, Cost-benefit analysis, Cost-benefit ratio, Social impact.
Identifiers: *Western U. S., *Opportunity cost, Sensitivity analysis, Planning, Programming and Budgeting System (PPBS).

The decision of where and when to invest public funds is frequently influenced by choice of which discount rate to apply to economic analysis of the proposed program. This is of particular relevance to public investment in water resource development programs for the arid western U.S., where benefit-cost analysis has been employed for many years. With increasing utilization in recent years of the Planning, Programming and Budgeting System (PPBS) for public decision making, the discount rate has assumed increasing importance in allocation of public investment funds. Four academic exponents present diverse opinions on subjects such as measurement of the social opportunity cost of public funds; changes in discount rate over a period of time; measurement of the opportunity cost of private investment and proposal of this measurement as proper for determining public discount rate; relationship between the opportunity cost of displaced private spending and the social discount rate; and the proposal that projects be evaluated with alternative discount rates and results of a sensitivity analysis. (Crouse-Ariz)

THE DISCOUNT RATE IN PUBLIC INVESTMENT EVALUATION, PART II; VIEWS FROM THE FEDERAL GOVERNMENT: A PANEL DISCUSSION,
Western Agricultural Economics Research Council, Denver, Colo. Committee on the Economics of Water Resources Development.
Harry A. Steele, Jim T. Casey, Charles F. Lemon, B. J. Tofani, and Kenneth J. Bousquet.
Water Resources and Economic Development of the West, Report 17: Discount Rate in Public Investment Evaluation, Part II: Views from the Federal Government: A Panel Discussion. p 83-106, 1968. 1 tab, 1 fig.

Descriptors: *Water resources development, *Discount rate, *Decision making, *Project planning, *Investment, Economic impact, Arid lands, Federal government, Soil conservation, Land reclamation, Multi-purpose projects, Water

policy, Interest rate, Budgeting, Economic justification, Economics, Planning, Programs, Social values, Cost-benefit analysis, Cost-benefit ratio.
Identifiers: *Western U. S., *Opportunity cost.

A panel of government officials representing major water resource development agencies such as Bureau of Reclamation, Soil Conservation Service, Department of the Army Corps of Engineers and U.S. Senate Committee on Appropriations discuss application of discount rate in project planning and their agency's views and experience. It is apparent that the difference between rates established by opportunity cost of private investment and those of social time preference is so great that the choice of either would drastically change formulation of water resource plans. This would have particular impact in the semiarid and arid Western U.S. where major water resource developments have long been evaluated on the basis of the coupon rate on long term government bonds. However, government financing policy has tended to keep the coupon rate very low in relation to the real average yield rate on all government securities. Attempts to establish guidelines for arriving at realistic and socially acceptable discount rates present a real challenge to planners and economists and will have great effect on water resource development programs. (Crouse-Ariz)

FORECASTING MUNICIPAL WATER REQUIREMENTS, VOLUME I - THE MAIN II SYSTEM, VOLUME II - THE MAIN II SYSTEM USER'S MANUAL.
Hittman Associates, Inc., Columbia, Md.

Available from the Clearinghouse as PB-190 275 (Vol I), PB-190 276 (Vol II), $3.00 each in paper copy, $0.65 each in microfiche. Hittman Associates Inc., HIT-413, September 1969. Vol. I, 208 p.; Vol. II, 425 p. OWRR Project C-1396.

Descriptors: *Water requirements, *Forecasting, *Municipal water, Water demand, Computer models, Statistical models, Computer programs, Regression analysis, Water management (Applied), Water utilization, Water demand, Evaluation, Cities.
Identifiers: Metropolitan water requirement model, Baltimore (Md), Baton Rouge (La), Columbia (Md).

A previously developed computer model of municipal water requirements, the MAIN I System, was used as a basis for a study of forecasting methods. The economic and demographic parameters of municipal water use were determined and their growth patterns analyzed. Data from 50 metropolitan areas were used to develop statistical models of the growth of these parameters. The models and other projection techniques were combined into a comprehensive forecasting method, named the MAIN II System. A computer program was prepared which incorporates the water requirements model as well as the forecasting system. Information required to prepare a water requirements forecast for an urban area is confined to readily available economic, demographic, and land--use data, and forecasts include detailed estimates for up to 200 water user categories. The MAIN II System was used to prepare forecasts for Baltimore, Md., Baton Rouge, La., and Columbia, Md. These case studies are presented and analyzed. Volume I describes the supporting research and the case studies. Volume II is a User's Manual, presenting a complete listing and flow chart of the computer program and giving detailed instructions for data preparation and use of the program. (See also W70-04691, W70-04692, W69-03201 and W69-03202). (Boland-Hittman)

MAIN C: COMPUTERIZED METHODOLOGY FOR EVALUATION OF MUNICIPAL WATER CONSERVATION RESEARCH PROGRAMS, VOLUME I -- DEVELOPMENT OF THE MAIN C SYSTEM, VOLUME II -- USER'S MANUAL AND SYSTEM DOCUMENTATION.
Hittman Associates, Inc., Columbia, Md.

Available from the Clearinghouse as PB-190 277 (Vol. I), and PB-190 278 (Vol. II), $3.00 each in paper copy, $0.65 each in microfiche. Hittman Associates Inc., HIT-409, August 1969. Vol I, 116 p.; Vol II, 313 p. OWRR Project C-1397.

Descriptors: *Water conservation, *Municipal water, Water requirements, *Economic impact, Computer models, Computer program, *Evaluation, Water utilization, Water management (Applied), Cities.

Existing literature and limited field studies were used to estimate, for each of 137 user categories, water use by purpose (kitchen, laundry, sanitary, cooling and condensing, etc.). These estimates were used to develop a computer model of municipal water use. Proposed water conservation devices, processes, or practices can be described in terms of their influence on water use for each purpose within each user category, and the computer model used to estimate the impact on the water demands of the entire community. A method for analyzing the economic impact of the water conservation measure is included in the model. Implementation costs, reductions in water utility operating costs, deferment of capital investments, and changes in revenue are included in the economic analysis. Volume I describes the supporting research and the design of the computer model. Volume II is a User's Manual, presenting a complete listing and flow chart of the computer program and giving detailed instructions for data preparation and the use of the program. MAIN I: A SYSTEM OF COMPUTERIZED MODELS FOR CALCULATING AND EVALUATING MUNICIPAL WATER REQUIREMENTS -- ADDENDUM TO FINAL REPORT.
Hittman Associates, Inc., Columbia, Md.

Available from the Clearinghouse as PB-190 272, $3.00 in paper copy, $0.65 in microfiche. Hittman Associates, Inc., Addendum to HIT-336 (W69-03201, W69-03202; PB-182 555, PB-182 556), October 1969. 58 p. OWRR Project C-1397.

Descriptors: *Water requirements, *Municipal water, Water demand, Computer programs, Computer model, Water management (Applied), Water utilization, Evaluation, Cities.
Identifiers: Metropolitan water requirement model, Baton Rouge (La), Anne Arundel County (Md), Baltimore (Md), Park Forest (Ill).

A computer model of municipal water requirements was developed under a previous program and named the MAIN I System. Experience with the application of this model in estimating current water requirements for Baton Rouge, La., Anne Arundel County, Md., Baltimore, Md., and Park Forest, Ill., led to modifications and improvements. This addendum reports these applications and documents the changes in the estimating method which resulted. Comments received on the original report are also reviewed and additional information presented on the basis of the computer model. Where actual water demand data were available, various estimates of demand for the cities studied were from 12.6 percent below to 2.5 percent above actual demands. Estimates for specific user categories and for specific months and seasons were also in close agreement (See also W70-04690 and W70-04691) (Boland-Hittman)

PETROLEUM INDUSTRY IN ILLINOIS, 1968: PART 2. WATERFLOOD OPERATIONS,
Illinois State Geological Survey, Urbana.
T. F. Lawry.
Illinois State Geological Survey Illinois Petroleum 92, p 67-122, 1969. 56 p, 5 tab

Descriptors: *Oil fields, *Illinois, *Flooding, *Injection wells, *Secondary recovery (Oil), Injection, Oil reservoirs, Brines, Saline water, Water utilization, Water demand.
Identifiers: Oil field waterflooding.

Forty-four new waterfloods were added in Illinois oil fields in 1968 while 50 waterfloods were abandoned and 12 waterflood listings were dropped for lack of data or because they were combined with other waterfloods. The area subject to fluid injection was increased by 11,500 acres in the new waterflood projects, and by 3600 acres in the expansion of older waterflood projects. Acreage subject to fluid injection is now approximately 47.7 of the total pay acreage in the state. (Knapp-USGS)

QUANTITATIVE ANALYSIS OF RESIDENTIAL WATER-USE PATTERNS IN MAYAGUEZ, PUERTO RICO,
Puerto Rico Univ., Mayaguez. Water Resources Research Inst.
Ausberto Guilbe.
PB-190 439. Water Resources Research Institute, School of Engineering, Mayaguez, Puerto Rico, June, 1969. 96p, 44 tabs, 20 fig, 3 append, 10 ref.

Descriptors: *Water utilization, *Correlation analysis, Computer models, Statistical models, Social aspects.
Identifiers: Mayaguez, Puerto Rico.

A practical functional relationship model to correlate residential water use with socio-economic factors which are known to influence the water usage is developed. The data was obtained from sample surveys. The collected data was subject to analyses in order to disclose the form of the relationship between water use and influencing factors. It was found that the influencing factor or independent variable is property value. Water use is the dependent variable. The property value was used as an indirect practical indicator of other factors. With regard to public dwellings it was found that the number of bedrooms, rather than property value, served as a significant independent variable. The computer program used in analyzing the data is included. (Grossman-Rutgers)

INDIANA WATER LAW AND SUGGESTIONS FOR ACTION,
G. Graham Waite.
Indiana Water Res Study Committee, 1968. 262 p, 746 ref, append.

Descriptors: *Indiana, *Water law, *Legislation, *Water rights, State governments, Local governments, Planning, Administrative agencies, Judicial decisions, Riparian rights, Public rights, Navigable waters, Non-navigable waters, Prescriptive rights, History, Lakes, Ponds, Streams, Legal aspects, Watercourses (Legal), Surface waters, Groundwater, Geographical regions, Spring waters, Artificial precipitation, Publications, Surveys.
Identifiers: *Legislative reports, *Studies.

The Indiana Water Resources Study Committee instituted this study and report on the existing law of water rights in Indiana. Chapter one examines private rights in water and deals in subdivisions with: (1) the physical setting and uses of Indiana's water; (2) riparian rights in surface watercourses; (3) the appropriation doctrine; (4) differences with respect to navigable and non-navigable watercourses; (5) differences with respect to streams, lakes, and ponds; (6) rights to diffused surface water; (7) rights to groundwater; (8) rights to use spring water and artificially developed waters; (9) the effect of rainmaking on water rights; (10) prescriptive rights; (11) transfer of water rights; and (12) remedies to protect water rights. Chapter two examines public rights in water and deals in subdivisions with: (1) general public rights; (2) early and recent judicial developments; and (3) statutory developments. Chapter three examines the impact on Indiana water law of administrative agencies and local units of government and, within the framework of two major subdivisions, deals at length with Indiana water administrative agencies, and with the role of local government in the shaping of Indiana water rights. (See also W70-04858 thru W70-04869). (Marsee-Florida)

INDIANA WATER LAW AND SUGGESTIONS FOR ACTION,
G. Graham Waite.
Indiana Water Res Study Committee, p 1-5, 1968.

Descriptors: *Indiana, *Hydrogeology, *Riparian land, *Watercourses (Legal), Riparian rights, Groundwater, Glaciers, Geomorphology, Lakes, Lake forming, Rivers, Streams, Terrain analysis, Topography, Irrigation effects, Irrigation, Water sources, Use rates, Water utilization, Recreation demand, Legal aspects, Judicial decisions, State governments, Regions, Slopes, Great Lakes Region.

Most of Indiana is from 500 to 1,000 feet above sea level. Generally hillier in the south than in the north, the land tilts slightly to the southwest, so that most of Indiana's streams and rivers flow southwest and ultimately into the Mississippi. The geology is varied and includes many remnants of glacial lakes. Thick glacial deposits are the state's most important source of groundwater. Both ground and surface water are readily available and usually plentiful; however, it is estimated that by 1975 an increasing population, irrigation needs during dry seasons, recreational demands, and other potential needs will double the volume of water used in 1954. In Indiana private water rights are governed by modifications of the riparian rights doctrine although there are few cases dealing with riparian rights in Indiana. 'Riparian land' has not been defined in this state although a statute not yet interpreted could be a basis for such definition. One Indiana court has attempted to broadly define 'watercourse' in terms of substantial existence and unity, and regularity and dependability of flow along a definite course. (See W70-04857). INDIANA WATER LAW AND SUGGESTIONS FOR ACTION,
G. Graham Waite.
Indiana Water Res Study Committee, p 5-11, 1968.

Descriptors: *Indiana, *Riparian rights, *Natural flow doctrine, *Reasonable use, Alteration of flow, Artificial use, Domestic water, Legal aspects, Legislation, Judicial decisions, Obstruction to flow, Relative rights, Riparian waters, Usufructuary right, Waste disposal, Irrigation, Impoundments, Consumptive use, Agriculture, State governments, Social values, Social impact.

The riparian rights doctrine, as first set forth, gave the riparian owner a right to the undiminished, unaltered, natural flow of a watercourse. Were this natural flow doctrine strictly applied, it would prohibit all consumptive uses of water. Indiana has developed the more pragmatic doctrine of 'reasonable use.' This doctrine allows reasonable interference with natural flow. Whether a particular use is reasonable is a question of fact and will depend upon the circumstances in the particular case. Some jurisdictions distinguish between domestic and artificial uses, allowing the riparian owner to satisfy his domestic needs even to the detriment of downstream riparians. Indiana case law has not recognized this distinction, but a recent statute has. Indiana courts have occasionally shown a reluctance to test the reasonableness of a commercial use by the social value of such use. Where a lower riparian owner causes water to back up onto the land of an upper riparian owner the courts have strictly held the lower riparian owner liable for all damages. (See W70-04857). INDIANA WATER LAW AND SUGGESTIONS FOR ACTION,
G. Graham Waite.
Indiana Water Res Study Committee, p 11-17, 1968.

Descriptors: *Indiana, *Prior appropriation, *Navigable waters, *Non-navigable waters, Riparian rights, Navigation, Rivers, Running waters, Streams, Ownership of beds, River beds, Public rights, Legal aspects, Federal government, Federal jurisdiction, Lakes, Watercourses (Legal), Priorities, Water rights, Preferences (Water rights), Judicial decisions, Legislation, State governments.

The report provides a survey description of the western appropriation doctrine and mentions similarities between that doctrine and Indiana's riparian rights doctrine. Indiana differentiates between navigable and non-navigable watercourses. Whether water is navigable or non-navigable is relevant in deciding questions of bed ownership, public rights of use, and federal regulation in particular bodies of water. Since 'navigable' does not have the same meaning in all these contexts, it becomes important to define the context in which the term is being used. Navigability is important in two situations concerning private rights. First, in deciding ownership of beds in Indiana it is necessary to know whether the body of water was navigable at the time statehood was attained. Second, if a particular body is navigable, riparian rights are subordinate to a public right of navigation. (See W70-04857). (Marsee-Florida)

Identifiers: *Navigability tests.

To decide who owns the bed of a lake, river, or stream in Indiana, it is necessary to know whether that body of water was navigable at the time the area became part of a state. The general rule provides that bed title passed to the state at that time if the water was navigable, but remained in the public if the water was non-navigable. Questions of bed ownership, such as the demarcation of the bed from the upland, and of navigability are federal questions. The federal test of navigability is one of fact, turning upon whether the waters are susceptible of being used in their ordinary and natural condition as highways for commerce. These commercial tests are capable of change with time and demand. For instance, recreation is a significant commercial use today but was not at the time of Indiana's admission to the Union. The most recent Indiana Supreme Court case on the relation of navigability to bed ownership adopted the federal rule on navigability, but this did not substantially change Indiana law. The Indiana common-law test was virtually the same as the federal test. (See W70-04857). (Marsee-Florida)

INDIANA WATER LAW AND SUGGESTIONS FOR ACTION,
G. Graham Waite.
Indiana Water Res Committee, p 22-25, 1968.

Descriptors: *Indiana, *Riparian rights, *Ownership of beds, *Public rights, Navigable waters, Non-navigable waters, Streams, Ponds, Lakes, Rivers, Land tenure, Federal government, State governments, Judicial decisions, Legislation, Legal aspects, Relative rights, Piers, Wetlands, Streambeds, Federal jurisdiction, Water rights, Riparian land.

When a body of water is navigable according to the federal test, the state wherein the water is situated has title to the bed. If the water is non-navigable, bed title is in the owner or owners of the adjoining land. There is a presumption that a grant of land adjoining non-navigable water carries title to the bed. It is well established in Indiana that the owner of a bed beneath such non-navigable waters may control the waters above the bed as if it were his land. Where waters are navigable, a riparian owner's rights are subject to a public right of navigation. The riparian owner may not unreasonably interfere with the right of navigation although he may build wharves which do not interfere with that right. Unlike bed-ownership problems, the public right of navigation does not require the application of federal law. Therefore the Indiana common-law test of navigability is applied. Although there may be some differences between public rights in lakes and those recognized in streams, Indiana seems to make no distinction between lakes, ponds, and streams with respect to riparian rights. (See W70-04857). (Marsee-Florida)

INDIANA WATER LAW AND SUGGESTIONS FOR ACTION,
G. Graham Waite.
Indiana Res Study Committee, p 25-30, 1968.

Descriptors: *Indiana, *Surface runoff, *Repulsion (Legal aspects), *Riddance (Legal aspects), Judicial decisions, Legal aspects, Runoff, Drainage water, Overland flow, Surface drainage, Surface waters, Drainage, Impounded waters, Impoundments, Diversion, Water pollution, Great Lakes Region, Water rights, Relative rights, Land use, Real property, Alteration of flow.

The distinguishing characteristic of diffused surface water is that it has no definite banks or channel as does surface water. Indiana follows the general rule that diffused surface water belongs to the person who captures and collects it on his land. Most of the legal problems related to diffused surface water involve attempts by landowners to rid themselves of such water by altering the natural drainage pattern so as to divert the water onto another's land. The liability of a landowner for such alteration in Indiana is determined by the common-enemy rule, subject to several modifications. The early common-enemy rule gave an owner unqualified right to do what he wished with diffused surface water including altering its course. This rule has been qualified in Indiana so that: (1) a landowner may not collect and then discharge such water; (2) a lower landowner may not collect surface water in an artificial channel and force it back upon upper land; (3) a landowner may not concentrate nor increase the flow onto other's land; and (4) he may not pollute such water. (See W70-04857). (Marsee-Florida)

A brief introduction to the law of groundwater is given, noting the distinction often made between underground streams and percolating water. Three doctrines define private rights to groundwater. The 'absolute ownership' doctrine holds that groundwater is part of the land on which it is found, and that the landowner has an absolute right to the water, provided he does not maliciously injure his neighbor. The 'reasonable use' doctrine, also proceeds upon the assumption that groundwater is part of the land; it limits the landowner to reasonable use of the water. The 'correlative rights' doctrine gives all owners of land over a common supply of groundwater correlative rights to the reasonable use of such water, provided they use it on overlying lands. In Indiana, the law of groundwater is unsettled. Early cases adopted the absolute ownership view. However, the later case of Gagnon v French Lick Springs Hotel Co., 163 Ind 687, 72 NE 849 (1904) makes it unclear whether Indiana still follows that view. An analysis of the case indicates that it probably has not changed the earlier Indiana law. (See W70-04857). (Marsee-Florida)

INDIANA WATER LAW AND SUGGESTIONS FOR ACTION,
G. Graham Waite.
Indiana Res Study Committee, p 40-54, 1968.

Descriptors: *Indiana, *Water rights, *Prescriptive rights, *Adjudication procedure, Conjunctive use, Natural flow doctrine, Riparian rights, Competing uses, Land tenure, Legal aspects, Judicial decisions, Relative rights, Water law, Water transfer, Water utilization, Consumptive use, Spring waters, Artificial precipitation, Water sources, Public rights, Damages.
Identifiers: Injunctions.

There are no Indiana cases dealing with: (1) the right to use spring waters; (2) the right to use artificially developed waters; (3) rights affected by rainmaking; or (4) the effect upon water rights of the interrelationship of water sources. In Indiana, water rights may be acquired by prescription except that there may be no acquisition of a prescriptive right in public waters. The elements of prescription in Indiana are discussed. Two examples of prescriptive water rights recognized in Indiana are the acquisition of an easement for drainage across another's land, and a right to maintain an unnatural condition which affects a watercourse. Certain prescriptive rights problems relating to consumptive use by riparian and non-riparian owners have not yet arisen in Indiana. Rights to water in Indiana may be conveyed separately, but these rights pass with the land unless reserved by the land's transferor. Indiana case law has recognized the following remedies to protect water rights: (1) damages; (2) injunction; (3) summary abatement or self-help; (4) apportionment or partition; and (5) declaratory judgment. (See W70-04857). (Marsee-Florida)

Identifiers: Northwest Ordinance.

Public water rights in Indiana are outlined within the framework of early and recent judicial developments, with special emphasis on key cases. Early cases almost invariably dealt with commercial, as opposed to recreational, navigation. These cases viewed the Northwest Ordinance as prohibiting physical obstructions of navigable watercourses. Today, court-made public rights in water exist in watercourses which are susceptible to commercial navigation. The Indiana courts have not customarily used the trust doctrine in judicially defining public rights. Public rights are not paramount to all private or state activities; the courts tend to take a balancing-of-interests approach. Thus, state authorized uses may be allowed at the expense of public rights. With a few exceptions, public rights in water do not limit riparian uses of the banks that do not physically obstruct navigation. The common-law public right includes removing sand from Lake Michigan's bed and probably from other streambeds. It probably includes recreational uses as well, although there has been no specific judicial determination of this. The public right is expressed as an easement of passage free from artificial obstruction. (See W70-04857). (Marsee-Florida)
W70-04866

INDIANA WATER LAW AND SUGGESTIONS FOR ACTION,
G. Graham Waite.
Indiana Res Study Committee, p 92-108, 1968.

Descriptors: *Indiana, *Legislation, Public rights, *Riparian rights, Lakes, Rivers, Streams, Riparian land, Ditches, Recreation, Recreation demand, Legal aspects, State governments, Navigable waters, Non-navigable waters, Impoundments, Consumptive use, Non-consumptive use, Navigation, Lake Michigan, Lake shores.

Although there is little case law in Indiana concerning public rights in water, there are many statutes. In 1955, water in any natural watercourse which may be applied to any 'useful and beneficial purpose' was declared to be public water of the state and subject to legislative regulation for the public welfare. It is unclear whether the phrase 'useful and beneficial' purposes includes recreation; however, two 1947 statutes declaring public rights broadly indicate that the right of recreation is a public right in water. The 1955 statute did limit the public right by subordinating such right to domestic uses and impoundments by riparian owners. The 1947 statutes do not make public rights depend on navigability. Apparently any use by the public is sufficient if acquiesced in by any riparian. This creates a constitutional problem concerning the exercise of the state's police power. Other statutes deal with: (1) zoning lakes for public use; (2) the power of county commissioners to declare waters in their counties navigable; and (3) the empowering of town trustees to determine and regulate the banks, shores, and wharves of any stream within the corporate limit. (See W70-04857). (Marsee-Florida)

INDIANA WATER LAW AND SUGGESTIONS FOR ACTION,
G. Graham Waite.
Indiana Res Study Committee, p 120-210, 1968.

Descriptors: *Indiana, *Administrative agencies, *State governments, *Water resources development, Legal aspects, Coordination, Institutions, Organizations, Permits, Regulation, Water allocation (Policy), Water rights, Public rights, Administration, Water law, Administrative decisions, Adoption of practices, Decision making, Leadership, Legislation, Judicial decisions, Standards, Water policy, Water zoning, Political aspects.

The impact of administrative agencies and local government units on Indiana water law is considered. The development of Indiana statutory law is discussed in light of: (1) the shift in water policy-making from local to state units of government; (2) the supplanting of court-made doctrine with legislation as a basis for determining important private and public rights in water; (3) and the emphasis placed on research by the Indiana Water Resources Study Committee. Two important Indiana water administrative agencies, the Division of Water of the Department of Natural Resources and the Stream Pollution Control Board, are discussed with emphasis placed upon the powers, responsibilities, and sources of authority of the former. Also discussed are the general administrative structures of the two agencies, and those integrating factors which draw the agencies together. Consideration is given to other state agencies with powers relating to water use, including the State Board of Health and the Public Service Commission. (See W70-04857). (Marsee-Florida)

GOVERNMENTAL REFILLING OF LAKES AND PONDS AND THE ARTIFICIAL MAINTENANCE OF WATER LEVELS: MUST JUST COMPENSATION BE PAID TO ABUTTING LANDOWNERS,
Robert E. Beck.
Texas Law Review, Vol 46, no 2, p 180-212, Dec 1967. 33 p, 113 ref.

Descriptors: *Riparian rights, *Dry beds, *Water level fluctuations, *Accretion (Legal aspects), State governments, Banks, Riparian land, Navigable waters, Ownership of beds, Riparian waters, Riparian water loss, Bank stability, Lakes, Beds under water, Beds, Lake beds, Boundaries (Property), High water mark, Low water mark, Compensation, Water levels, Fluctuation, Bodies of water, Ponds, Recreation facilities, Water resources development.
Identifiers: *Water level maintenance.

With proposals for refilling and artificially maintaining water levels of lakes and ponds for recreation purposes, there arises the problem of compensation for riparian landowners who would have become entitled to alluvion that would have formed but for the refilling. The initial question is whether the riparian right to alluvion, especially the right to future alluvion, is property. Authority is split on the question of the right to alluvion as a vested right, so the decision must be one of policy. The interest of the state in its water resources is placed opposite the interests of the riparian in the land and in having access to the waters. Since a property right may exist, the state may argue that it has not damaged the riparian's property rights by relying on either its interests in the waters within the state or its ownership of the bed under the waters. Under certain circumstances the property right may be properly taken or damaged, but the problem of compensation is complicated by problems in predicting how much alluvion was lost and what its value would have been. (See also W70-04871 thru W70-04873). (Douberley-Florida)
W70-04870

GOVERNMENTAL REFILLING OF LAKES AND PONDS AND THE ARTIFICIAL MAINTENANCE OF WATER LEVELS: MUST JUST COMPENSATION BE PAID TO ABUTTING LANDOWNERS,
Robert E. Beck.
Texas Law Review, Vol 46, no 2, p 180-189, Dec 1967.

Descriptors: *Riparian rights, *Dry beds, *Water level fluctuations, *Accretion (Legal aspects), Flooding, Riparian land, Recreation facilities, Lakes, Beds, Lake beds, Boundaries (Property), Water levels, Bodies of water, Ponds, Recreation, Relative rights, Flood damage.
Identifiers: *Water level maintenance.

There have been proposals for refilling and artificially maintaining water levels of lakes and ponds for recreational purposes; these projects, however, often would result in flooding abutting land. One of the littoral rights of adjacent landowners is the right to alluvion bared by reliction and accretion. There is some question whether inundation caused by refilling or maintaining levels should be considered as a taking of property that would require compensation. Courts are split on whether the riparian right to alluvion, especially to future alluvion, is a vested property right. Cases that treat the right to alluvion as a property right do not deal with future alluvion. Many courts take a 'lump-sum' approach that considers all riparian rights together and attempts to put them into existing classifications of property interests. A 'separate-evaluation' approach is more useful. This approach looks at each component of riparian rights separately and classifies each separately. Some riparian rights might be treated as vested property rights if separately evaluated, while others would be considered only contingent. A few cases hold that the right to future alluvion is vested, but others reject it as a property right. (See 70-04870). (Douberley-Florida)
W70-04871

GOVERNMENTAL REFILLING OF LAKES AND PONDS AND THE ARTIFICIAL MAINTENANCE OF WATER LEVELS: MUST JUST COMPENSATION BE PAID TO ABUTTING LANDOWNERS,
Robert E. Beck.
Texas Law Review, Vol 46, no 2, p 190-195, Dec 1967.

Descriptors: *Riparian rights, *Accretion (Legal aspects), *Riparian land, *Dry beds, Bank stability, Water resources development, Prior appropriation, Recreation, Recreation facilities, Water sources, Groundwater, Acess routes, State governments, Riparian water loss, Water levels, Fluctuation, Water rights.

Some states do not include the right to future alluvion in their list of recognized riparian rights. The western states reject the concept of riparian rights altogether. The decision of whether the right is considered vested or is treated as a mere contingency is one of policy, requiring the interests of the state to be balanced against those of the individual. The state has an interest in the maximum use of water, especially in light of increasing demands on water for recreational purposes. The task of restoring water levels rests with the state as an exercise of its police power. The state either has an existing tangible public interest in some waters within its jurisdiction, or it may acquire authority through procedures similar to those used in establishing drainage districts. Since the low water levels were caused by a man-made deficit of water sources, it would not seem that the state should have to pay to restore those levels. The primary substantive right of the abutting landowner is the maintenance of his status as a riparian owner by maintaining access to the waterbody. That right would be retained by maintaining water levels. (See W70-04870). (Douberley-Florida)
W70-04872

GOVERNMENTAL REFILLING OF LAKES AND PONDS AND THE ARTIFICIAL MAINTENANCE OF WATER LEVELS: MUST JUST COMPENSATION BE PAID TO ABUTTING LANDOWNERS,
Robert E. Beck.
Texas Law Review, Vol 46, no 2, p 195-212, Dec 1967.

Descriptors: *Riparian rights, *Dry beds, *Water level fluctuations, *Accretion (Legal aspects), High water mark, Low water mark, Navigable waters, Ownership of beds, Low-flow augmentation, State governments, Beds under water, Beds, Lake beds, Boundaries (Property), Compensation, Water levels, Fluctuation, Lake morphology, Lake shores, Damages, Erosion, Flood damage, Reasonable use.

The law regarding formation of alluvion is not an impediment to the state in most cases. The permanent drying up of the bed is not necessarily enough for the riparian owner to acquire rights to alluvion. The recession must be permanent, gradual and imperceptible. States may assert that there has been no taking of property by alleging either a paramount property right or by a valid exercise of the police power. Either argument requires balancing public and private interests. Each state has an interest in at least some waters within its boundaries. Levels may be artificially maintained to promote navigation, and this may be extended to include recreational uses. Further, states own at least some beds, usually under navigable waters, and maintaining the water level is a reasonable use of that bed, assuming the bed extends to the high water mark. Just compensation is difficult to determine because a determination of how much alluvion the owner has lost is highly speculative. Further, since title is frequently not quieted, value is difficult to determine. (See W70-04870). (Douberley-Florida)
W70-04873

WATER RIGHTS IN TENNESSEE,
Mahlon L. Townsend.
Tennessee Law Review, Vol 27, No 4, p 557-568, Summer 1960. 12 p, 98 ref.

Descriptors: *Ownership of beds, *Navigable rivers, *Subsurface waters, *Accretion (Legal aspects), Beds under water, Streambeds, Boundaries (Property), Low water mark, Non-navigable waters, Riparian rights, Natural flow doctrine, Alteration of flow, Civil law, Diversion, Surface drainage, Percolating water, Underground streams, Riparian land, Obstruction to flow, Reasonable use, Water pollution, Bank erosion, Dams, Natural flow, River flow, Access routes.

In Tennessee, water rights and riparian rights depend upon the navigability of the waterbody. Generally, the public retains substantial rights in navigable waters. The owner's title to riparian land may change by virtue of gradual changes due to erosion and accretion, but not by avulsion. The reasonable use doctrine applies to all riparian owners adjacent to running streams. Streams may be dammed or diverted, so long as there is no injury to other owners or substantial inconvenience to navigation. Diffused surface waters belong to owners of the beds beneath them. Natural flow from higher lands may not be obstructed, although damage caused by unnatural discharges is actionable. Underground streams are subject to the same laws as surface streams. The correlative rights doctrine applies to percolating waters that do not flow in an established channel. (See also W70-04875 and W70-04876). (Douberley-Florida)
W70-04874

WATER RIGHTS IN TENNESSEE (FLOWING STREAMS),
Mahlon L. Townsend.
Tennessee Law Review, Vol 27, No 4, p 557-564, Summer 1960. 7 p, 65 ref.

Descriptors: *Tennessee, *Surface waters, *Running waters, *Riparian rights, Navigable rivers, Streams, Bank erosion, Streambeds, River beds, Navigable waters, Stream erosion, Ownership of beds, Natural flow, Alteration of flow, River flow, Low water mark, Obstruction to flow, Civil law, Non-navigable waters, Riparian waters, Navigation, Reasonable use, Accretion (Legal aspects), Boundaries (Property), Water pollution.
Identifiers: Navigability in fact.

A stream is legally or technically navigable if it meets the civil law test; that is, if it is suitable for the usual purposes of navigation. A stream not legally navigable may become navigable in fact when flooding raises the water level. The public owns the beds of legally navigable streams; the title of riparian owners extends to the ordinary low water mark. Title to the bed of a stream only navigable in fact is in the riparian owners, subject to a public easement for navigation. A stream not navigable at all is subject to private ownership. Accretion deposited gradually becomes the property of the riparian owner, but he may lose land by erosion. Land may become riparian because of erosion, and it does not lose that status if accretion restores eroded land. Title to riparian land does not change because of rapid avulsion. A stream navigated by the public for more than twenty years may not be obstructed unless a greater public benefit is created by the obstruction. The reasona-

ble use doctrine applies to use of water by riparian owners, and reasonable diversions are allowed. A riparian owner may construct dams, but not so as to injure other riparian owners. All pollution is unlawful. (See W70-04874). (Douberley-Florida)
W70-04875

WATER RIGHTS IN TENNESSEE (DIFFUSED SURFACE WATERS AND UNDERGROUND WATERS),
Mahlon L. Townsend.
Tennessee Law Review, Vol 27, No 4, p 564-568, Summer 1960. 5 p, 33 ref.

Descriptors: *Tennessee, *Surface runoff, *Surface waters, *Subsurface waters, Drainage, Drainage water, Repulsion (Legal aspects), Riddance (Legal aspects), Standing waters, Overland flow, Surface drainage, Natural flow, Discharge (Water), Prior appropriation, Excess water (Soils), Precipitation excess, Easements, Obstruction to flow, Flooding, Percolation, Underground streams, Percolating water, Channels, Reasonable use.

Diffused surface waters are those not in natural streams or channels; they flow over the land, usually following precipitation. Such waters belong to the owner of the land. The owner of an upper tract has an easement on the lower tract for drainage of diffused surface waters. The flow cannot be obstructed so as to overflow the higher land. The upper owner may not discharge unnatural quantities of water onto the lower land. Damage to a building caused by water drainage from an adjacent building is actionable. Rights to surface waters may be acquired or lost by prescription and transferred by conveyance. Underground flowing streams are subject to the law applicable to surface streams. Unless the channel is established, the waters are presumed to be percolating, and the correlative rights doctrine is applied to them. The landowner is entitled to reasonable use of the water percolating through his land. The owner of a spring or well is entitled to damages for both surface and underground pollution. (See W70-04874). (Douberley-Florida)

PRESENT AND PROPOSED LEGAL CONTROL OF WATER RESOURCES IN WISCONSIN,
Glenn R. Coates.
Wisconsin Law Review, Vol 1953, no 2, p 256-296, Mar 1953. 41 p, 102 ref.

Descriptors: *Wisconsin, *Water conservation, *Water demand, *Water allocation (Policy), Water supply, Water distribution (Applied), Administration, Permits, Legal aspects, Water sources, Competing uses, Riparian rights, Reasonable use, Water policy, Domestic water, Industrial water, Recreation, Irrigation practices, Legal aspects, Surface waters, Surface irrigation, Administrative agencies, Regulation.

Conflict over water use continues to increase between irrigators and sportsmen. The former desire further consumptive use of water, while the latter oppose any dimunition of surface waters which might endanger marine life and recreation. Irrigation has recently expanded from specialty crops to grains and pastures, increasing the demand on the state's water supply. The growing Wisconsin tourist industry, on the other hand, depends to a great extent upon fishing and other water recreation. Other increases in domestic and industrial consumptive uses further complicate the problem. A review of legislation and common law water rights doctrine reveals that little has been done to uniformly regulate the competing demands upon the water supply. The author suggests adoption of the Water Diversion Act, which places authority to deal with competing uses that result in water diversion under a public service commission. Generally, permits would be required before water could be diverted from water courses or ground sources, and an overall policy of water allocation could be developed. There is evidence that sufficient economic necessity exists to support the constitutionality of this type of water control under the Wisconsin Constitution. (See also W70-04878 thru W70-04880). (Kelly-Florida)
W70-04877

PRESENT AND PROPOSED LEGAL CONTROL OF WATER RESOURCES IN WISCONSIN (RIPARIAN RIGHTS AND SURFACE WATERS),
Glenn R. Coates.
Wisconsin Law Review, Vol 1953, No 2, p 263-268, Mar 1953.

Descriptors: *Wisconsin, *Water rights, *Riparian rights, *Surface waters, Water demand, Reasonable use, Water policy, Water allocation (Policy), Competing uses, Relative rights, Streamflow, Natural flow, Administration, Judicial decisions, Legal aspects, Legislation, Regulation, Permits.

Surface waters may be defined as waters flowing continuously or intermittently in natural surface channels from definite sources of supply, and waters flowing through lakes, ponds, and marshes which are integral parts of a stream system. The flow must be of sufficient quantity to form a bed and banks. In Wisconsin, the existence of a watercourse is a question of fact for the jury. Wisconsin has exclusively adopted the doctrine of riparian rights. An owner of land contiguous to a watercourse has a right to have the water flow by or through his land substantially undiminished in quantity or quality, subject to an upper riparian owner's right to make reasonable use of the water as it flows by his land. The riparian right cannot be taken for a public purpose without compensation. Legislation gives the riparian owner full protection of his right to natural flow, but prohibits consumptive use of the water without a Public Service Commission permit. Legislation also protects public water rights. The author suggests that protective legislation has substantially diminished the privilege of reasonable use. (See W70-04877). (Kelly-Florida)
W70-04878

PRESENT AND PROPOSED LEGAL CONTROL OF WATER RESOURCES IN WISCONSIN (DOCTRINE OF PRIOR APPROPRIATION),
Glenn R. Coates.
Wisconsin Law Review, Vol 1953, no 2, p 268-270, Mar 1953.

Descriptors: *Wisconsin, *Prior appropriation, *Water rights, *Beneficial use, Adjudication procedure, Appropriation, Diversion, Administrative agencies, Preferences (Water rights), Industrial water, Legal aspects, Legislation, Permits, Irrigation water, Priorities, Reasonable use, Remedies, Water utilization, Usufructuary right, Regulation.

The doctrine of prior appropriation has been recognized and enforced by the courts of some states in deference to well recognized practices by laymen in a number of Western states. The doctrine provides that the right to use water arises from a diversion of water plus application of that diverted to beneficial use. Priority in time gives the better right, and location of land in respect to the watercourse is not a factor. Some states adapting this doctrine require that applications for permits be made to the state engineer before diversion of water may be commenced. The doctrine of prior appropriation is thought to be preferable to the riparian doctrine in encouraging efficient water use. There are faults in the former doctrine, however, which permit an early appropriator to divert a greater amount of water than he can efficiently use, so long as his use is beneficial. The author suggests that increased administrative regulation and more emphasis on beneficial use rather than priority would make the doctrine more workable. (See W70-04877). (Kelly-Florida)
W70-04879

PRESENT AND PROPOSED LEGAL CONTROL OF WATER RESOURCES IN WISCONSIN (DIFFUSED SURFACE WATERS; GROUNDWATER; AND A PROPOSED WATER DIVERSION ACT),
Glenn R. Coates
Wisconsin Law Review, Vol 1953, No 2, p 270-296, Mar 1953.

Descriptors: *Wisconsin, *Groundwater, *Water rights, *Surface runoff, Surface-groundwater relationships, Drainage water, Base flow, Groundwater movement, Prescriptive rights, Water wells, Water supply, Water demand, Administration, Water distribution (Applied), Legal aspects, Regulation, Impoundments, Legislation, Reasonable use.

Diffused surface waters occur on the surface of the earth in places other than defined water courses, lakes, or ponds. Riparian rights do not attach to such waters. Judicial difficulties have arisen in Western states with regard to the impounding of diffused surface water which is the source of supply for a watercourse. Groundwater is construed in Wisconsin to exclude defined underground streams. Groundwater includes only percolating waters, and underground streams are treated in the same manner as surface water. A landowner may withdraw all the water he wishes by wells on his own land under Wisconsin common law. The legislature has curtailed this unrestricted use, however, and requires permits to be obtained before more than a certain daily volume of water may be withdrawn. Other states have adopted a reasonable use limitation under common law. Some states have extended appropriation principles to all groundwater, giving the greatest right to owners of the land overlying the supply. It is contended that the Wisconsin rule gives approval to destruction of groundwater levels through individual waste. (See W70-04877). (Kelly-Florida)

6F. Nonstructural Alternatives

RATIONAL INVESTMENT BEHAVIOR IN THE FACE OF FLOODS,
California Univ., Berkeley. Center for Research in Management Science.
C. B. McGuire.
Available from the Clearinghouse as PB-190 270, $3.00 in paper copy, $0.65 in microfiche. California University Center for Research in Management Science, Final Report for period July 1967-March 1969. 142 p, 13 fig, 62 ref, 2 append. OWRR Proj No C-1120.

Descriptors: *Statistical models, *Non-structural alternatives, *Flood plains, *Beneficial use, *Simulation analysis, Stochastic processes, Mathematical models, Dynamic programming, Systems analysis, Social aspects, Legal aspects, Economics, Flood damage, Flood plain zoning, Planning, Probability, Investment.
Identifiers: Flood plain use.

An economic, stochastic model was studied for predicting rational investment behavior in the face of floods. A computable model was made of people's reactions, in terms of economic decisions, to changes in such things as flood control policies, flood relief policies, flood insurance, information (or beliefs) about floods and damages, production technology, available economic activities, commodity prices, and interest rates. Together with hydrological data about the stochastic nature of flood occurrences, the model then may be made to serve either prescriptive or descriptive uses; that is, either (1) to tell a landowner how he ought to behave in terms of proper choice and management of the production activity on his land, or (2) to predict how a rational landowner will behave in these same terms. HYDROLOGIC DATA FOR RESERVOIR DESIGN,
Geological Survey, Washington, D.C.
H. C. Riggs.
French resume included. In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 540-550, 1966. 11 p, 8 fig, 14 ref.

Descriptors: *Streamflow forecasting, *Reservoir design, *Data collections, *Surveys, Networks, Stream gages, Gaging stations, Climatic data, Hydrologic data, Water storage, Reservoirs.
Identifiers: *Reservoir design data.

Definition of a draft-storage relation should be based on a streamflow record of considerable length from a network of stream gaging stations. However, because few gaging stations are located at sites subsequently selected for reservoirs, a streamflow inventory of a region, suitable for use in reservoir design, must include information which will permit development of draft-storage relations anywhere in the region. Draft-storage characteristics can be related to the within-year variability of streamflow and to the mean and variability of annual mean flows. Such relations defined from gaging station records, can be applied to other sites at which the variables in the relation can be estimated. Within-year variation can be represented by the median annual low flow which can be estimated from a few base flow measurements. Methods are given for estimating the mean and variability of annual mean flow from both humid and semi-arid basins. Examples of each of the methods described above show that the results are adequately reliable for design bases. A suitable data-collection network would consist of stream gaging stations, base flow discharge measurements at many sites, sediment and chemical-quality sampling stations, and climatological stations. 7B. Data Acquisition

USE OF TRACERS IN HARBOR, COASTAL AND OCEAN ENGINEERING,
Norges Tekniske Hoegskole, Trondheim. Dept. of Port and Ocean Engineering.
P. Bruun.
Engineering Geology, Vol 4, No 1, p 73-88, January 1970. 16 p, 24 fig, 1 tab, 33 ref.

Descriptors: *Tracers, *Tracking techniques, Radioactivity techniques, Bibliographies, Dye releases, Sediment transport, Tagging, Analytical techniques, Fluorescence, Marking techniques, Flow, Hydraulics.
Identifiers: Tracer techniques.

The uses of tracers in ocean, harbor, coastal, and river engineering are described. Some applications of tracers in pollution control are described in detail. Tracers and analytical techniques used in studying drift patterns and flow rates are listed. A bibliography of theoretical and practical references is included. (Knapp-USGS)
W70-04551

DETERMINATION OF SELENIUM BY THE RING OVEN TECHNIQUE,
Missouri Univ., Kansas City. Dept. of Chemistry.
Donald W. Dickey, James H. Wiersma, Russell G. Barnekow, Jr., and Peter F. Lott.
German summary included. Mikrochimica Acta, Vol 3, p 605-610, 1969. 6 p, 1 tab, 8 ref. OWRR Proj No A-009-MO, NIH Grant GM 12830-02.

Descriptors: *Chemical analysis, *Trace elements, Geochemistry, Water chemistry, Water analysis, Toxicity, Water pollution effects, Soil contamination effects.
Identifiers: *Selenium.

A simple semi-quantitative fluorometric method for selenium analysis has been developed which employs the reagent 2,3-diaminonaphthalene and the ring oven technique. By this procedure selenium can be determined to 10 ppb; the optimum working range is 20-80 ppb. The concentration of selenium is ascertained by visual observation of the rings under long wavelength UV light. (Knapp-USGS)

SENSOR DETECTION CAPABILITIES STUDY,
Geological Survey, Washington, D.C.
John E. Wilson.
Report available free on application to the U S Geological Survey, Washington, D C 20242. Geological Survey Circular 616, 1969. 26 p, 7 fig, 1 tab, 25 ref. NASA Contract No W-12570, task No 160-75-01-31-10.

Descriptors: *Remote sensing, *Aerial photography, *Radar, *Exploration, Surveys, Investigations, Water resources, Research and development, Evaluation, Resource development, Resources, Natural resources, Water resources.
Identifiers: Remote sensor capabilities.

Ten sensors used in collecting data for earth resources studies were investigated and rated. Four major variables which affect the selection of an appropriate sensor are: (1) Target and background identity; (2) Sensor availability; (3) Sensor capabilities and characteristics; and (4) Data collection system economics. Sensor records that were viewed and rated included: (1) Black and white photography; (2) Color photography; (3) Infrared (IR) color photography; (4) Black and white infrared photography; (5) 2- to 4-micron thermal infrared imagery; (6) 8- to 14-micron thermal infrared imagery; (7) Side-looking radar (SLAR) imagery; (8) Electro-optical (television) imagery; (9) Imaging microwave imagery; and (10) Nonimaging scatterometer data. Of the 98 targets considered in this evaluation, 89 indicated that a photographic system held the greatest promise of object detection. Infrared, side-looking radar, scatterometer, and passive microwave each were capable of significant contributions over one or more of the listed targets. (Knapp-USGS)

AUTOMATIC METHODS FOR THE ANALYSIS OF NATURAL WATERS,
Wisconsin Univ., Madison. Water Chemistry Lab.
G. Fred Lee.
Proceedings of International Biological Program Symposium Held in Amsterdam and Nieuwersluis, Netherlands, October 10-16, 1966. Chemical Environment in the Aquatic Habitat, G L Golterman and R S Clymo, editors, N V Noord-Hollandsche Uitgevers Maatschappij, Amsterdam, 1967. p 169-180. 2 fig, 1 tab, 32 ref, Comment.

Descriptors: *Chemical analysis, *Water chemistry, *Instrumentation, Alkylbenzene sulfonates, Colorimetry, Volumetric analysis, Limnology, Monitoring, Water pollution, Water quality, Phosphates, Chlorides, Bicarbonates, Carbonates, Hydrogen ion concentration, Calcium, Magnesium, Chemical oxygen demand, Dissolved oxygen, Sulfates, Organic acids, Flame photometry, Fluorometry, Nutrients, Vitamins, Enzymes.
Identifiers: *Automated methods, Data acquisition, Electrometric methods, Technicon AutoAnalyzer, Fisher Scientific Automatic Titrator, Coulometry, Conductometry, Atomic absorption spectroscopy.

Water pollution monitoring and limnochemical research programs often require chemical analyses of large numbers of samples. Automated procedures for colorimetry and electrometry have been used and offer even greater promise for the future. In a typical colorimetric application, the Technicon AutoAnalyzer, key development of which is a reliable proportionating pump, assemblages of various modules make possible analyses involving diverse manipulations including distillation, solvent extraction, dialysis, and precipitation. Possibility of replacing colorimeter with other detectors (flame photometer, atomic adsorption spectrophotometer, continuous flow fluorometer) insures greater flexibility. A table of 40 water analyses which have been automated includes procedures diverse as alkyl benzene sulfonates, chemical oxygen demand, plant nutrients, and various vitamins and enzymes. Example of an automated phosphate analysis is described in detail. Automated procedures may permit greater precision, and, due to careful control of conditions at each step, may allow use of reactions which do not proceed to completion. Automatic and semi-automatic titrations are also effective. The paper describes a European example of titrimetry which permits nine separate analyses. Future developments in automation will include self-contained monitoring stations for collection of limnological data. A list of American equipment manufactures is included. (See W70-04821). Identifiers: *Organic solutes, Vitamin B-12, Thiamine, Biotin, Radiocarbon uptake techniques, Algal enumeration, Microbial ecology, Data acquisition, Cyclotella nana, Gyrodinium cohni, Phycomycetes, Isolate S-3, Cryptococcus albidus, Monochrysis lutheri, Amphidinium carteri.

A variety of microorganisms have been used in bioassays for minute concentrations of ecologically important vitamins (B-12, biotin, thiamine) dissolved in the hydrosphere. Assay procedures are outlined for seawater in which radiocarbon uptake or cell numbers can be evaluated after incubation of organisms in nutrient-enriched media under carefully controlled conditions. Both internal standards, to assess seawater toxicity, and external standards, to establish a calibration curve, are utilized. Organisms employed in the assays (with effective assay ranges, in nanograms/liter, indicated in parentheses) are: B-12--Cyclotella nana (0.05-3); thiamine--Monochrysis lutheri (2-35); biotin--Amphidinium carteri (0.2-5). Data derived from such bioassays are reported for stations of the North Pacific Ocean along a transect from Kodiak, Alaska, to Honolulu, Hawaii. Ranges of concentrations (in nanograms/liter) reported are: B-12, undetectable-0.88; thiamine, 3.4-32.0; biotin, 1.0-3.0. Concentrations of vitamin B-12 are apparently inversely correlated with biomass of chlorophyll and zooplankton. Microbiological assays described here detect concentrations considerably lower than do methods described previously, and they are sensitive in ecologically important ranges. (See W70-04821). VOLUME TWO-TECHNICAL DEVELOPMENT PLAN, NATIONAL DATA PROGRAM FOR THE MARINE ENVIRONMENT.
System Development Corp., Santa Monica, Calif.

System Development Corporation Technical Memorandum TM-4023/006/00, July 31, 1969. 216 p, 11 fig, 58 tab, append. ONR Contract No N00014-67-C-0559.

Descriptors: *Data storage and retrieval, *Data processing, *Information retrieval, *Oceanography, Documentation, Management, Planning, Methodology, Project planning, Systems analysis, Technology, Marine geology.
Identifiers: Data systems, Data management.

The objective of the Technical Development Plan (TDP) is to improve marine data products and services provided by the Federal Government to a variety of users. The TDP recommends that products and services be improved both by enhancing existing products and services and by introducing new products and services. Recommendations are also made for increases in data acquisition, improvements in existing data bases and the development of new data bases. The mechanisms chosen for achieving greater benefits for users are (1) the upgrading of Federal agency data service and product operations and (2) the improvement of the marine data network for the collection, transmission, storage and dissemination of marine data. A 10-year, time-phased plan was designed to provide the resources necessary to achieve the improvements. The TDP includes provisions for new instrumentation and new data communication and processing hardware, hardware costs, software development and maintenance, software personnel and costs, computer operations personnel and costs, and application and discipline personnel and costs. AN INVENTORY OF THE PONDS, LAKES, AND RESERVOIRS OF MASSACHUSETTS-BARNSTABLE COUNTY,
Bureau of Sport Fisheries and Wildlife, Amherst, Mass.
James A. McCann.
Water Resources Research Center, University of Massachusetts, Amherst, Publication 10-1, Dec, 1969. 102 p, 119 maps, 17 ref. OWRR Project A-999-MASS.

Descriptors: *Data collections, *Surveys, *Land use, *Water utilization, Fishing, Recreation, Water quality, *Massachusetts, Limnology.
Identifiers: *Cape Cod.

This is an inventory of the physical, biological and land-water use characteristics of all ponds, lakes, and reservoirs over five acres or identified on U.S. Geological topographic maps of Barnstable County, Massachusetts. Data from published sources or from official files of federal, state and regional water resources agencies were summarized, recorded on standard forms, coded, and keypunched on automatic data processing cards. The physical characteristics of the ponds were updated to include all standing bodies of water over five acres located on serial photographs taken in the spring of 1965.

ANALYSIS OF WATERSHED CHANGES,
Hydrocomp International, Palo Alto, Calif.
Norman H. Crawford.
In: Effects of Watershed Changes on Streamflow Water Resources Symposium No 2, Austin, Texas, October 1968, p 27-34, University of Texas Press, Austin and London, 1969. 8 p, 4 fig, 2 tab, 6 ref.

Descriptors: *Model studies, *Simulation analysis, *Rainfall-runoff relationships, Urbanization, Computer models, Mathematical models, Statistical models, Routing, Runoff, Streamflow forecasting, Probability, Systems analysis.
Identifiers: Watershed models, Watershed changes.

Watershed changes can be classified by purpose as altering runoff volumes, flow duration characteristics, or floodflows. Changes in runoff volumes and changes in flow duration characteristics require land surface changes. Land surface changes occur in agricultural activities, in forest fires, and in urbanization. In general, the hydrologic effect of

land surface change is only one of many considerations. Deliberate land surface changes are seldom carried out for hydrologic benefits only; where farming practices are changed, agricultural as well as hydrologic benefits are sought. Hydrologic damages are seldom sufficient to prevent planned land surface activities. Digital computer hydrologic simulation is particularly helpful in interpreting land surface changes. Flows can be simulated before and after a change to find the effect of the change on infiltration rate and soil moisture storage. Channel system changes are well suited to analysis with current programming techniques. Interaction between land surface runoff sequences and channel network response can be easily studied for scores of combinations of physical works. This is most helpful in tracing physical interactions between several projects in a watershed. (See W70-04723). (Knapp-USGS)

JUDGMENT FACTORS IN INSPECTION OF DAMS,
Harza Engineering Co., Chicago, Ill.
Andrew Eberhardt.
Water Power, Vol 21, No 11, p 431-435, Nov, 1969. 5 p, 4 ref.

Descriptors: Decision making, *Inspection, *Dams, Earth dams, Concrete dams, Dam foundations, Spillway design flood, Design flood, Design data, *Safety, Safety factors, Risks, Hazards, Responsibilities, Operation and maintenance, Performance, Exploration, Investigations, Rehabilitation, Reliability.
Identifiers: *Engineering evaluation, Remedial treatment, Spillway capacity, Flood estimate.

Good engineering judgment is essential in designing dams, and may be more important in making decisions about the competency of existing dams. Several cases are cited, pointing out some problems and judgment factors involved in evaluating competency of existing dams. Problems discussed are: (1) lack of and unreliability of data about investigation, design, construction, and performance; (2) misleading appearances; (3) poor and incorrect operation and maintenance; (4) owners' uncooperation and judgments based on past successful performance; (5) design shortcomings; and (6) lack of money for investiations and remedial measures. Judgment-type decisions about dams require weighing against each other elements of safety, risk, cost, practical limitations, and possible damages. Every dam that impounds water presents a potential danger that should be neither underestimated nor overestimated; risk of sudden disaster is forever inescapable. There are challenges to accept, responsibilities to bear, and consequences to face in inspecting and designing dams. (USBR)

STRUCTURAL ANALYSIS BY COMPUTER GRAPHICS,
Lockheed-Georgia Co., Marietta.
William F. Bates, Jr., and William M. Cox.
Proc Amer Soc Civ Eng, J Struct Div, Vol 95, No ST11, p 2433-2448, Nov 1969. 16 p, 16 fig, 2 ref, 2 append.

Descriptors: *Computer models, *Computer programs, *Structural analysis, *Graphical analysis, Computers, Computer systems components, Structural design, Analysis, Data processing, Structural engineering, Structural models.
Identifiers: Computer-aided design, Computer capability, Man-machine systems, Matrix methods (Structural).

The emerging uses of computer graphics in structural engineering and design, especially in transferring numerical output into visual graphical form, are discussed. A 2-dimensional structure analysis program developed for a computer system at Lockheed-Georgia Laboratory is described. Civil engineering is a prime field for implementing computer graphics to reduce calculation time and quantity of input. Future expansion of computer graphics in engineering is described. Uses being developed include some that will display 3-dimensional structural arrangements and permit broader man-machine interaction in input and output phases. Also under development is the kinematic analysis of 3-dimensional mechanisms to optimize space requirements and maintain clearance. Computer graphics points the way toward better man-machine communication in all phases of design. (USBR)

SOME ESTIMATES OF THE THERMAL EFFECTS OF A HEATED PIPELINE IN PERMAFROST,
Geological Survey, Washington, D.C.
Arthur H. Lachenbruch.
Report available free on application to the US Geological Survey, Washington, DC 20242. Geological Survey Circular 632, 1970. 23 p 6 fig, 8 tab.

Descriptors: *Permafrost, *Melting, *Pipelines, *Alaska, Frozen ground, Frost heaving, Mud, Ice, Soil mechanics, Tundra, Engineering geology, Ecology.
Identifiers: Pipeline design, Permafrost engineering.

As one means of transporting crude oil from oil fields on the Alaskan Arctic coast to a year-round ice-free port, a large pipeline traversing most of the state of Alaska from north to south has been proposed. Plans call for a pipe 4 feet in diameter, which will be buried along most of the route in permafrost. The initial heat in the oil plus frictional heating in the pipe are expected to maintain oil temperatures in the neighborhood of 70 deg to 80 deg C (158 deg to 176 deg F). Such an installation would thaw the surrounding permafrost. Where the ice content of permafrost is not high, thawing by the buried pipe might cause no special problems. Under adverse local conditions, however, this thawing could have significant effects on the environment, and possibly upon the security of the pipeline. In this report a few basic principles are applied to simplified models of permafrost regimes to identify some effects of a heated pipe, the conditions that control them, and the approximate ranges of physical properties for which these effects are likely to result in problems. RATIONAL ULTIMATE-STRENGTH COMPOSITE-BEAM ANALYSIS,
Missouri Univ., Columbia.
James W. Baldwin, Jr.
Report, University of Missouri, Columbia, Civil Engineering Dept, 1969. 22 p, 8 fig, 2 ref.

Descriptors: Shear strength, Shear forces, *Beams (Structural), Moment distribution, Compressive strength, Structural steel, Concretes, Stress analysis, Structural members, Structural engineering, Structural design, *Structural analysis, Analysis.
Identifiers: *Ultimate strength design, *Ultimate strength, *Composite beams, Hybrid beams, Shear connectors.

The moment capacity of a composite beam varies along the length of the beam, and the ultimate strength is not necessarily governed by the section at which maximum moment occurs. An ultimate strength analysis that allows computing ultimate moment capacity at any section of a concrete on steel composite beam is presented. The analysis can be applied to beams having partial length cover plates, unsymmetrical sections, hybrid sections, or any combination of these features. Computations for complete moment capacity diagrams are lengthy, but for design purposes, computations need be made only for sections likely to be critical. Generally, sections of maximum moment, sections at concentrated loads, and sections at abrupt changes in geometry should be investigated. Indiscriminately using uniform spacing of shear connectors may lead to unconservative design.

. . . THE ROMAN DAMS OF SUBIACO,
Imperial Coll. of Science and Technology, London (England).
Norman A. F. Smith.
Technology and Culture, Vol. 11, No. 1, p58-68, January 1970.

Descriptors: *Reservoirs, *Dam design, *Dam failure, Damsites, Recreation, Water supply, History.
Identifiers: Italy, Roman Empire.

In the Aniene valley above Subiaco, Italy, are the sites of three dams, constructed during the first century A.D., which are of great interest for three reasons: first, they were built primarily for recreational purposes related to the nearby villa of Nero; second, they were, as far as is known, the only dams which the Romans built in their own country; and third, one of them, was probably the highest dam, about 130 feet, in the Roman Empire and perhaps in the world until the Alicante dam, in Spain, of 1594. The dams apparently continued in use up to medieval times. The largest dam did not collapse until 1305, according to contemporary records, when two monks took stones from the dam in an attempt to lower the level of the impounded water which was flooding their lands. This articles discusses the probable damsites, remains, construction, and use in relation to ancient sources, a previous 19th century investigation, and a painting of 1428 in the monastery of Saint Benedict which seems to depict the saint fishing from the crest of the dam. A drawing based upon this painting is a part of the article and is also used as the front cover design for this issue of Technology and Culture. (Cowgill-OWRR)

THE IJSSEL LAKE AS A MULTI-PURPOSE RESERVOIR,
Zuider Zee Works (Netherlands). Hydrology Section.
C. H. De Jong.

French resume included. In: Hydrology of Lakes and Reservoirs, Symposium of Garda (Oct 9-15, 1966), International Association of Scientific Hydrology, Publication No 71, p 565-574, 1966. 10 p, 3 fig, 1 ref.

Descriptors: *Reservoirs, *Multiple-purpose reservoirs, *Drainage, *Water storage, *Land reclamation, Land management, Water levels, Water-level fluctuations, Canals, Pumping, Evaporation, Inflow, Hydrologic budget, Streamflow forecasting, Water quality.
Identifiers: *Netherlands, IJssel Lake, Polders.

The IJssel Lake is an important part of the Zuiderzee project, which is being carried out in the Netherlands to extend the land area by reclamation and to improve the water management of a large area around the lake. The lake has to satisfy various interests such as drainage of and water supply to surrounding areas, navigation, fishing, and recreation, each with its own demands with regard to the management of the lake. Since some of the adjacent areas have a ground level almost 5 m lower than mean sea level and are densely populated with increasing industrialization, inundation has to be prevented even under extreme circumstances of heavy storms and high water levels on the lake. The efficiency of the water management of the lake is judged by the level of the lake, the available amounts of water during droughts and the quality of the water. The variations of these factors depend on the size, normal level, and dimensions of the discharge sluices. They are interrelated via the equations of continuity for the water and the salt in the lake. The methods for the design of the lake are discussed. (Knapp-USGS)

MEASURED WAVE FORCE DATA ON OFFSHORE PLATFORMS,
Chevron Oil Field Research Co.
L. W. Thrasher, and P. M. Aagaard.
Journal of Petroleum Technology, p 339-346, March 1970. 8 p, 9 fig, 3 tab, 3 ref.

Descriptors: *Waves (Water), *Ocean waves, *Offshore platforms, *Hurricanes, *Energy, Hydrodynamics, Data collections, Hydraulics, Coastal engineering, Instrumentation.
Identifiers: Hurricane wave forces.

Wave forces on vertical cylinders and wave profiles were measured with instruments on two oil production platforms in 30 ft (1954-1958) and 100 ft (1960-1963) of water, respectively, in the Gulf of Mexico. Wave data were recorded during a number of storms and for waves up to 40 ft high. The purpose of the paper is to present the following background information that defines the wave force data being made available: (1) instrumentation, (2) raw data collected, (3) data processing steps, and (4) location of archives. (Knapp-USGS)
W70-04699

ANALYSIS OF WAVE FORCE DATA,
Shell Development Co., Houston, Tex.
D. J. Evans.
Journal of Petroleum Technology, p 347-358, March 1970. 12 p, 23 fig, 2 tab, 19 ref.

Descriptors: *Waves (Water), *Ocean waves, *Energy, Hurricanes, Hydrodynamics, Hydraulics, Offshore platforms, Coastal engineering.
Identifiers: Morison wave force equation, Stokes wave theory.

Wave profile and wave force data acquired in the Gulf of Mexico from several hurricanes have been analyzed to provide the drag and inertial coefficients of Morison's wave force equation. These coefficients are required to help determine design loads for offshore structures. An analysis, using nonlinear wave theories, of profile and force data from waves in shallow water gave drag and inertial force coefficients of 0.5 and 1.2, respectively. Data acquired in 100 ft of water gave a slightly larger drag coefficient (0.58) and a larger inertial coefficient (1.76). Good agreement between measured and predicted forces was observed. (Knapp-USGS)

METHOD FOR CALCULATING FORCES PRODUCED BY IRREGULAR WAVES,
Esso Production Research Co., Houston, Tex.
J. D. Wheeler.
Journal of Petroleum Technology, p 359-367, March 1970. 9 p, 11 fig, 4 tab, 14 ref.

Descriptors: *Ocean waves, *Energy, *Hurricanes, *Offshore platforms, Waves (Water), Hydraulics, Hydrodynamics, Coastal engineering, Mathematical studies.
Identifiers: Wave force, Airy theory, Morison wave force equation.

A new method is described and evaluated for calculating wave forces on offshore structures. It is based on an extension of Airy theory for two-dimensional waves and uses a linear filtering technique to calculate wave forces as a function of time for wave profiles of arbitrary shape and length. It is especially useful for evaluating the forces exerted on offshore structures by a sequence of irregular storm waves. The accuracy of the method is checked by comparison with measured hurricane-wave forces. (Knapp-USGS)
W70-04701

WAVE FORCES: DATA ANALYSIS AND ENGINEERING CALCULATION METHOD,
Florida Univ., Tallahassee; and Chevron Oil Field Research Co.
R. G. Dean, and P. M. Aagaard.
Journal of Petroleum Technology, p 368-375, March 1970. 8 p, 11 fig, 2 tab, 17 ref.

Descriptors: *Waves (Water), *Ocean waves, *Energy, *Offshore platforms, Hydrodynamics, Hydraulics, Coastal engineering, Computer programs, Mathematical models, Unsteady flow.
Identifiers: Morison wave force equation.

A mthod for calculating ocean wave forces on offshore drilling structures is based upon (1) data from two full-scale wave force measurement installations in the ocean and (2) a mathematical model representing hydrodynamic forces on submerged bodies in unsteady flow and the kinematic flow field of highly nonlinear waves. The method is applicable to a broad range of wave conditions commonly encountered in offshore structure design. Several comparisons show that the method represents measured forces satisfactorily for engineering design. (Knapp-USGS)

RADIATION TRANSFER AND INTERACTION OF CONVECTION WITH RADIATION HEAT TRANSFER,
Purdue Univ., Lafayette, Ind. School of Mechanical Engineering.
R. Viskanta.
Advances in Heat Transfer, Vol 3, p 175-251, Acad. Press, New York, London, 1966, 20 fig, 100 ref.

Descriptors: *Heat transfer, *Temperature, *Radiation, Microwaves, Conduction, Heating, Cooling, Thermal radiation, Laminar flow, Turbulent flow, Viscous flow, Fluid mechanics, Reynolds number, Boundary layers, Velocity, Momentum equations.

The purpose of the review is: (1) to develop general background information to analyze heat transfer in radiating media, and (2) to review the literature of some specific convection-radiation interaction problems. The radiation terms were included in the equations of continuity, motion, and energy, and an approximate solution was obtained for some flow patterns (Couette flow, laminar boundary layer flow, heat transfer to a radiating fluid flowing in a channel). The solution of the more complex equation is very time consuming even with the use of fast digital computers. (Novotny-Vanderbilt)
W70-05035

THE EFFECT OF FREE STREAM TURBULENCE ON HEAT TRANSFER RATES,
Brown Univ., Providence, R. I. Div. of Engineering.
J. Kestin.
Advances in Heat Transfer, Vol. 3, p. 1-32, Acad. Press, New York, London, 1966, 20 fig., 51 ref.

Descriptors: *Heat transfer, *Turbulence, Boundary layers, Turbulent boundary layers, Reynolds number, Heating, Cooling, Conduction, Convection, Heat flow, Temperature, Heat pollution, Flow around objects, Fluid mechanics.
Identifiers: Hydraulics of heat transfer.

The effect of free stream turbulence on the size of Nusselt's number, which characterizes heat flow, is discussed. Different methods of applying of the boundary layer theory are presented. The sound field which produces the harmonic oscillation can be used for studying of effects of oscillations on heat transfer instead of stochastic oscillations of the turbulence. An oscillating free stream velocity produces in a laminar boundary layer two main effects: (1) the velocity components u and v in the boundary layer themselves become time dependent, so that $u = u(x,y,t)$. (2) The oscillation inside of the boundary layer acquires a varying phase shift whose magnitude depends on the transverse coordinate y. Calculations showed that the skin friction coefficient on the plate boundary increases much less (by 5% for Pr approximately 0.7) than the Nusselt number (which increased by 26%) compared with the classical case of two-dimensional flow with zero vorticity in the approaching stream. It was found that the turbulence intensity expressed in % of (sq. root of u to the 12th power)/U has a small effect on the heat transfer coefficient in most cases. (Novotny-Vanderbilt)

HEAT AND MASS TRANSFER IN TURBULENT BOUNDARY LAYERS,
Akademiya Nauk SSSR, Novosibirsk.
A. I. Leonter.
Advances in Heat Transfer, Vol. 3, p. 33-100, Acad. Press, New York, London, 1966, 90 ref.

Descriptors: *Heat transfer, *Mass transfer, Boundary layer, Reynolds number, Films, Temperature, Turbulence, Convection, Conduction, Flow, Flow around objects, Heating, Cooling, Fluid mechanics.

The problem of heat exchange in flow with a high Reynolds number is discussed. Under these conditions, the relative thickness of the viscous sublayer tends to approach zero and the problem is reduced

to analyzing the influence of different disturbing factors as nonisothermality, mass transfer, longitudinal pressure gradient, etc. The theoretical base for the formulae developing was Prandtl's theory. It was found that in the compressible turbulent boundary layer on a flat impermeable plate, the effect of Reynolds number has little influence on the relative values of friction and heat transfer coefficients. The effect of a finite Reynolds number on the friction and heat transfer lows on a permeable plate is even smaller than that on impermeable plates. The mathematical presentation of theory developed in Russia is described. (Novotny-Vanderbilt)
W70-05037

ADVANCES IN FREE CONVECTION,
National Engineering Lab., East Kilbride (Scotland).
A. J. Ede.
Advances in Heat Transfer, Vol. 4, p. 1-64, Academic Press, New York, London, 1967, 111 ref.

Descriptors: *Convection, *Heat transfer, *Energy transfer, Turbulence, Turbulent boundary layer, Eddies, Reynolds number, Viscosity, Air circulation, Water circulation, Boundary processes, Conduction, Momentum transfer, Mixing, Cooling, Heating, Heat balance.
Identifiers: Theory of heat transfer.

Convection of heat in laminar and turbulent flow is discussed. Solution to the equations of continuity, motion and energy are used as a base for further theoretical development. The problem of cooling on a flat plate leads to the following general formula: Nu = f (Gr x Pr) to the 1/4 power, where Gr = Grashof number, Pr = Prandtl number and Nu = Nusselt number, all expressing the major heat flow parameters. Different solutions to this equation are discussed and comparison with experimental data are presented. Similar solutions were applied also to the solution of cooling (heating) in turbulent flow. It is generally assumed that the Grashof number or the Rayleigh number (Gr x Pr) serves as the criterion for stability in free heat convection and the Reynolds number for forced heat convection. Different solutions of the Nusselt number for turbulent flow expressing the flow of heat lead to the formula Nu = BGr (n), where the exponent n was found to be found to be 0.25 divided by 0.33 in most cases. (Novotny-Vanderbilt)

STATISTICAL MODELS FOR SURFACE RENEWAL IN HEAT AND MASS TRANSFER,
Argonne National Lab., Ill.
L. B. Koppel, R. D. Patel, and J. T. Holmes.
AIChE Journal, Vol. 5, No. 5, September 1966, p. 941-955, 3 tab., 7 fig., 4 ref. AEC Contract W-31-109-eng-8.

Descriptors: *Surfaces, *Mixing, Turbulence, Heat transfer, Mass transfer, Diffusion, Conduction, Heating, Cooling, Thermal properties, Thermal pollution, Thermal conductivity, Temperature, Hydraulics, Turbulent flow, Statistical models, Monte Carlo method.

In Part I, Average transport coefficients for different transport models are computed by using widely varying distributions of residence times of elements at the transporting surface. It is shown that, for typical transport models, the shapes of the residence time and age distributions have an insignificant effect on the average transport coefficient. Operational techniques for calculating average coefficients and for constructing delayed versions of age distributions are presented. Residence time distribution may be generated by the gamma form which offers the following advantages for representation of residence time distribution: (1) The residence times are defined over an interval from zero to infinity, (2) This distribution offers convenient operational properties for calculating the average transport coefficient. Computation of Nusselt numbers of heat transport in fluidized bed is presented. In Part II, methods are developed to estimate the mean residence time and the average transport coefficients of elements at a transporting surface from observations of only total elements counts, rather than from specific observations of individual elements. The accuracy of the methods is demonstrated in Monte Carlo simulated processes and experimentally at the wall of a gas-fluidized bed. (Novotny-Vanderbilt)
W70-05039

EXACT SIMILAR SOLUTION OF THE LAMINAR BOUNDARY-LAYER EQUATIONS,
Colorado Univ., Boulder.
C. F. Dewey, Jr., and J. E. Gross.
Advances in Heat Transfer, Vol. 4, p. 317-446, 1967. 14 fig.

Descriptors: *Boundary layer, Temperature, Convection, Mass transfer, *Heat transfer, Velocity, Reynolds number, Viscosity, Turbulence, *Laminar flow, Turbulent flow, Energy transfer, *Numerical analysis, Computers, Viscous flow.
Identifiers: Laminar boundary layer.

Comprehensive, systematic and accurate tables of solution to the laminar boundary-layer similarity equations were computed for a perfect homogeneous gas. Solutions are included to illustrate the effect of leading edge sweep, the mass transfer at the surface, pressure gradient, the boundary temperature, local external flow velocity, the Prandtl number, and the viscosity-temperature law of the fluid. The program for the numerical integration of the system of equations expressing the continuity, motion, and energy balance was written in FORTRAN for the IBM 7044. The system was treated as a two-point boundary value problem, and the Runge-Kutta method was employed for the numerical integration. (Novotny-Vanderbilt)
W70-05040

TURBULENT HEAT TRANSFER FROM SMOOTH AND ROUGH SURFACES,
Toronto Univ. (Ontario). Dept. of Chemical Engineering and Applied Chemistry.
R. A. Gowen, and J. W. Smith.
International Journal, Heat and Mass Transfer, Vol. 11, p 1657-1673, Pergamon Press, New York, London, 1968, 20 ref, 20 fig, 4 tab.

Descriptors: *Heat transfer, *Convection, Turbulence, Temperature, Momentum transfer, Turbulent flow, Thermal properties, Reynolds number, Air temperature, Water temperature, Velocity, Roughness.

Radial temperature profiles have been obtained in a 2-in I.D. rough tube of equivalent sand roughness equal to 0.05 for Prandtl numbers of 0.7, 5.9 and 14.3 over a Reynolds number range 10,000-50,000. Plots of t (+) against log y/R are linear as in the case of u (+) for rough and smooth tubes, but the slope depends on Prandtl number and inferentially on the roughness. The t (+) intercept at log y/R = 0 is strongly dependent on the Reynolds number, unlike u (+) in turbulent rough pipe flow. An expression for the relation between t (+) and log y/R is presented, but the dependence of the slope AR on roughness remains to be determined. The heat-transfer efficiency St/CF was less in rough tubes than smooth ones for all the fluids studied, but the relative difference becomes smaller at higher Prandtl number and in the turbulent transition region. Friction factors and heat-transfer coefficients have also been measured in seven different 1/2-in I.D. rough pipes of known surface geometry. Equivalent sand roughness ranged from 0.021 to .095 for the pipes studied. A semi-theoretical equation based on the temperature profiles obtained in the 2-in. pipe predicts the results of the present study and Nunner's air results adequately. It underestimates the water results of Dipprey. (Novotny-Vanderbilt)
W70-05041

FLOW AND HEAT TRANSFER IN THE BOUNDARY LAYER ON A CONTINUOUS MOVING SURFACE,
Minnesota Univ., Minneapolis. Heat Transfer Lab.
F. K. Tsou, E. M. Sparrow, and R. J. Goldstein.
International Journal Heat and Mass Transfer, Vol. 10, p. 219-235, 1967. 11 ref., 11 fig.

Descriptors: *Heat transfer, Boundary processes, Mass transfer, Turbulent flow, Laminar flow, Mixing, Reynolds number, Turbulent boundary layers, Viscosity, Energy transfer, Momentum transfer, Convection, Velocity, Friction, Viscous flow.
Identifiers: Laminar boundary layers.

A combined analytical and experimental study of the flow and temperature fields in the boundary layer on a continuous moving surface has been carried out. The investigation includes both laminar and turbulent flow conditions. The analytical solutions provide results for the boundary-layer velocity and temperature distributions and for the surface-friction and heat-transfer coefficients. Measurements of the laminar velocity field are in excellent agreement with the analytical predictions., thereby verifying that a mathematically describable boundary layer on a continuous moving surface is a physically realizable flow. Experimentally determined turbulent velocity profiles are also in very good accord with those of analysis. Similar agreement is found to exist for friction coefficients deduced from the data by application of the Clauser-plot technique. Temperature distribution measurements, carried out for the turbulent boundary layer, show satisfactory correspondence with analysis. (Novotny-Vanderbilt)

SONIC POLE TESTS PROVE RELIABLE AND INEXPENSIVE,
Detroit Edison Co., Mich.
R. B. Freydl, and B. D. Miller.
Transm Distrib, Vol 21, No 11, p 37-41, Nov, 1969. 5 p, 7 fig, 2 tab, 2 ref.

Descriptors: Costs, Instrumentation, X-ray inspection, Field tests, Laboratory tests, *Ultrasonics, Electronic equipment, Defects, *Sound waves, Wood, Inspection, Transmission lines, Power operation and maintenance.
Identifiers: *Sonic-pulse test, Sonic probes, *Wood-pole transm lines, Cost savings, Ultrasonic tests, Test results.

A sonic test instrument developed for determining defects in wood poles is fast, reliable, and economical. Results of the testing technique on nearly 300,000 poles during the past 3 yr have been successful and the per-pole cost of inspection has been reduced substantially. The sonic testing device is a 5-lb, portable, transistorized meter that evaluates the time required for a sound pulse to travel from one side of a pole to the other. Longer than normal travel time indicates decay or defect. The probes normally can be pushed through the earth against the pole without digging to test below the ground surface. Only poles showing defects must be checked by the X-ray method. The sonic test is fail-safe, showing pole characteristics other than pole life or strength. (USBR)

EXCITATION CONTROL FOR SYSTEM DAMPING TESTS ON MODEL SYSTEM,
Bureau of Reclamation, Denver, Colo.
F. R. Schleif.
Bur Reclam Lab Rep EP-32, Aug, 1969. 41 p, 10 fig, 3 tab, 20 oscillograms, 4 ref.

Descriptors: *Electric power, Model studies, *Control systems, Faults (Electrical), Voltage regulators, Governors, *Stabilization, *Damping, Transmission (Electrical), Electric generators, *Excitation, Model tests.
Identifiers: Electrical system simulators, *Excitation regulators, Power system stability.

Performance tests of supplementary excitation control apparatus for system damping, conducted on the Edison Electric Institute model system in cooperation with the AC/DC System Operation Research Project, have been very revealing. Flexibility of the model permitted evaluation under a range of conditions not conveniently obtainable on one power system. Evaluations included: (1) influence of local resistive and induction motor loads, (2) performance during system faults, (3) signal cutoff vs signal limit-type constraints, and (4) performance on a-c and on a-c and d-c transmission systems with and without modulation of the latter for damping. Effectiveness and compatibility were good. The mechanism of damping, characteristics, and applicability are discussed. (USBR)
W70-04623

DIELECTRIC STRENGTH OF OIL-IMPREGNATED INSULATION UNDER HVDC STRESSES,
Brown, Boveri and Co. Ltd., Baden (Switzerland).
G. Maier, and H. J. Vorwerk.
Brown Boveri Rev, Vol 56, No 5, p. 246-255, May 1969. 10 p, 14 fig, 1 tab, 5 ref.

Descriptors: *Dielectrics, *Electric insulation, *Direct current, Transformer oils, Impulse tests (Electrical), Electric potential, Power transformers, Electric reactors, Converters (Electrical), Transmission lines, Foreign research, Electrical equipment, Electrical insulators, Stress, Alternating current, Polarity.
Identifiers: *Electrical insulation tests, *High voltage, Dielectric properties, Test results, Withstand level (Electric), Switzerland.

Converter transformers, smoothing reactors, and auxiliary power apparatus used in hvdc transmission systems have insulation similar to that in a-c voltage equipment. The primary insulating materials are oil, oil-impregnated paper, transformer board, and in certain cases bakelized synthetic resin-bonded paper. The materials in hvdc systems are under different stresses than materials in a-c applications. In one instance, the dielectric voltage distribution obeys different laws, and in the other, the breakdown phenomena and dielectric properties are different compared to the a-c voltage conditions. These particular features must be taken into consideration when designing hvdc systems, assuming that new problems are known and that adequate experience has been gained regarding the behavior of the insulating materials under given conditions. Simple models were used to perform tests on the main insulating materials including oil, oil-impregnated paper, and transformer board using specific voltages similar to those occurring in the converter transformers and smoothing reactors in hvdc stations. Various guides were derived from the measured results, indicating the aptness of some voltage tests on finished equipment. (USBR)

DIELECTRIC STRENGTH RECOVERY CHARACTERISTICS AFTER FAULT ARC EXTINCTION IN 500-KV TRANSMISSION LINES,
Chubu Electric Power CO. (Japan).
H. Terase, K. Sadamoto, and K. Abe.
Elec Eng Japan, Vol 89, No 2, p. 29-38, 1969. 10 p, 8 fig, 1 tab, 5 ref.

Descriptors: *Dielectrics, *Faults (Electrical), *Transmission lines, *Electrical insulators, Electric currents, Extra high voltage, Electric insulation, Experimental data, Electric arcs, Electric potential, Recovery, Photographs, Foreigh research, Characteristics, Electrodes, Time.
Identifiers: *Dielectric properties, Ionization potentials, Japan, *Suspension insulators, Photographic analysis, Test results.

The study of dielectric strength recovery characteristics after fault arc extinction is important in determining the no-voltage time of a high-speed, 3-phase, reclosing system. Few papers have discussed the problem, and few experimental studies have been reported. Large fault current interruption is discussed. The dielectric strength recovery characteristics of suspension insulators and V- and dead-end strings in 500-kv transmission lines were studied by applying a probing voltage of slow wavefront to the insulators at about 5 cycles after the interruption of a fault arc current of 8 ka. Results from the high-speed camera photograph show that the behavior of a luminous gas cloud emerging from arcing horns is related closely to the recovery characteristics. (USBR)

DISCHARGE MEASUREMENTS USING THE RADIOISOTOPE VELOCITY, INTEGRATED SAMPLE, DILUTION, AND TOTAL COUNT METHODS AT FLATIRON POWER AND PUMPINS PLANT, COLORADO-BIG THOMPSON PROJECT,
Bureau of Reclamation, Denver, Colo.
J. C. Shuster, and R. L. Hansen.
TID-25185, U S Atom Energy Comm, Contract AT (49-11)-2758, July 1969. 41 p, 28 fig, 15 tab, 1 ref, addend.

Descriptors: *Water measurements, *Radioisotopes, *Tracers, *Discharge measurements, Hydraulics, Physics, Fluorometry, Penstocks, Field tests, Pump turbines, Water sampling, Turbines, Injectors, Pipelines, Radioactivity techniques, Colorado.
Identifiers: *Velocity method, *Total count method, *Dilution method, Flatiron Powerplant, Colo, Atomic Energy Commission.

Radioisotopes techniques and equipment are being developed to improve methods for measuring flow rate in high-head turbines and pumps. A series of discharge measurements was made in 1968, at Flatiron Power and Pumping Plant near Loveland, Colo, to evaluate techniques and equipment. Measurements were made on a 6000-ft-long, 6-ft-dia penstock at a discharge of 300 cfs. Thirty-seven injections of radioactive Bromine-82 were made for discharge measurements by the velocity method, 17 for the integrated-sample method, and 8 for the dilution method. The injections enabled computation of 33 discharges by the velocity method, 26 by the integrated sample method, 45 by the dilution method, and 34 by the total-count method. A 4-point injection system, 45 deg from the vertical and horizontal centerlines of the pipe, was used for most measurements. Mixing lengths ranged from 36 to 919 pipe diameters. Mixing lengths of 100 pipe diameters produced the same order the accuracy as mixing lengths of 919 diameters. Studies are continuing to increase measurement accuracy using pipe lengths as short as 30 pipe diameters. (USBR)

30 YEARS OF MAINTENANCE EXPERIENCE WITH LARGE KAPLAN TURBINES,
Corps of Engineers, Bonneville, Oreg
Edward E. Ashley.
Amer Soc Mech Eng Publ, 69-WA/FE-17, Nov 1969. 8 p, 16 fig, 1 tab.

Descriptors: *Kaplan turbines, *Maintenance, Failure (Mechanics), Turbine parts, Thrust bearings, Hydroelectric plants, Turbine blades, *Bonneville Dam, Power operation and maintenance, Corrosion, Lubrication, Repairing, Contamination, Turbines, Costs.
Identifiers: Wicket gates, Packings.

Major problems encountered during 30 yr of operating large Kaplan turbines at the Bonneville Project are described. A few problems have been solved; others are being reviewed. The problem area includes theturbine and equipment associated with the turbine. Problems have involved: (1) grease line failure to the wicket gate lower bearing, failure of the wicket gate combination thrust and guide bearing, failure of the wicket gate stop block, and failure of a turbine guide bearing; (2) replacement of head cover sump pumps; and (3) maintenance of the turbine shaft packing box, turbine hub, wicket gate servomotor packing, Kaplan turbine blades, and oil head. Each problem is discussed and methods used in solving the difficulty are given. (USBR)

DESALINATION PLANTS USING HIGHER STEAM PRESSURES,
Catalytic Construction Co., Philadelphia, Pa.
W. Pechenick, and C. E. Ennis.
Preprint SM-113/31 of Paper Presented at IAEA Symp. Nucl. Desalination, Madrid, Spain, Nov. 18-22, 1968. 8 p, 8 ref.
Identifiers: *Dual-purpose plant economics, Dual-purpose plant, Multiple effect distillation, Multistage flash distillation, Scale prevention, Single-purpose plant, Single-purpose plant economics, Steam cycle, Turbines, Vapor compression evaporation.

Distillation plants may use high pressure steam (above 150 psig) in one of two ways - as a source of mechanical energy in vapor compression or as a source of thermal energy directly in high temperature plants. High temperature operation has been made possible by development of the Mems plant and by development of improved scale control processes making 350 deg F operation feasible. Increasing the pressure range over which plants can utilize steam broadens the economic scope of desalting. Single-purpose plants, typified by a VC design can prove economical over a broader range of capacities and cost parameters. Dual-purpose plants may now be designed over a greater range of water-to-power ratios than was possible at lower pressures.

LARGE COMBINED AXIAL- AND MIXED-FLOW PUMP,
Bureau of Reclamation, Denver, Colo.
Ernest H. Johnson.
Pap 69-WA/FE-31, Amer Soc Mech Eng Publ, 1969. 8 p, 9 fig, 1 tab.

Descriptors: *Axial flow, *Propeller pumps, *Mixed flow pumps, *Pumps, Mechanical equipment, *Models, *Model tests, Design, Cavitation, Pump bowls, Vibrations, Efficiencies, *Hydraulic design, Instrumentation, Discharges, Specifications, Pump testing, Performance tests.
Identifiers: *Snake Creek Pumping Plant (N Dak), *Test results, High head, Garrison Diversion Unit (MRBP), Low head.

The large 685-cfs, 200-rpm, vertical-column main pumps to be installed by the Bureau of Reclamation at Snake Creek Pumping Plant No. 1, Garrison Diversion Unit, Missouri River Basin Project, N Dak, are described. Each pump has interchangeable axial- and mixed-flow bowl assemblies covering a head range of 2 to 76 ft. This arrangement combines 2 types of pumps into one. The wide head range resulted in a selection of 2 to 35 ft for the low-head, axial-flow bowl assembly, and 35 to 76 ft for the high-head bowl assembly. The time between bowl assembly interchange will depend upon runoff and reservoir storage conditions and will occur at intervals varying from 2 to 9 yr. The interchange operation will require about 2 days per pump. Model tests indicate an excellent design meeting or exceeding all requirements of the specifications. Model operation was smooth and quiet without apparent cavitation throughout the normal operating head range of each bowl assembly; no excessive vibration occurred from minimum to shutoff head. (USBR)

8D. Soil Mechanics

AIRPHOTO INTERPRETATION OF FLOOD PLAIN SOILS,
Wisconsin Univ., Madison.
Ralph W. Kiefer.
Proc Amer Soc Civ Eng, J Surv Mapp Div, Vol 95, No SU1, p 49-70, Oct 1969. 22 p, 16 fig, 32 ref, append.

Descriptors: *Aerial photography, *Photogrammetry, *Flood plains, *Soil surveys, Soil formation, Flood plain zoning, Land use, Mapping, Remote sensing, Soils, Soil types, Terrain analysis, Planning, Photography, Project planning, Radar, Soil classifications, Soil investigations, Soil texture, *Soil surveys, Bibliographies, Geological surveys, Sensors.
Identifiers: *Aerial interpretation, *Photointerpretation, *Airborne surveying, *Flood plain studies, Soil deposits, Airborne equipment.

Urban planners and developers are giving increasing emphasis to the problems of land use on flood plains. To plan effectively for land use on flood plains, the distribution of soil types on the flood plain and the flood frequency must be known. The use of aerial photographic interpretation techniques for estimating flood plain soil conditions is described. New techniques of airborne remote sensing can also prove useful in flood plain soil studies. Imaging sensors such as infrared photography, color photography, infrared imagery, and side-looking airborne radar, as well as several nonimaging sensors, are described. To plan successfully for land use on flood plains, all available planning tools must be utilized. Much valuable information about flood plain soils can be obtained through aerial photographic interpretation studies. (USBR)
W70-04630

THE PHYSICS AND MECHANICS OF SOIL,
California Inst. of Tech., Pasadena.
Ronald F. Scott.
Contemp Phys, Vol 10, No 5, p 449-472, Sept 1969. 24 p, 18 fig, 8 ref.

Descriptors: *Soil formation, *Soil physics, *Soil mechanics, Soil analysis, Soil classifications, Soil compaction, Soil engineering, Soil groups, Soils, Soil properties, Flexible foundations, Earthworks, Reviews, Soil tests.
Identifiers: Soil characteristics, Soil development, Lunar soils.

The processes of soil formation, present knowledge of soil behavior, and techniques of soil engineering are reviewed. The origin of soil is in chemical processes of comminution and abrasion of rock masses and in physical processes of solution and recrystallization of rock minerals. After formation, soil is transported and distributed by a variety of agencies before subaerial or subaqueous deposition. Most soils experience several cycles of sedimentation, uplift, erosion, and redeposition. Mechanical behavior of soils under the stresses imposed by engineering structures varies with the type of soil. Deformation and failure of soils are of interest in designing structures, and must be studied by special laboratory tests. Solving soil engineering problems involves a field investigation and sampling program to define the boundaries of the soil involved, laboratory testing of the soil, and analytical or computer calculations to determine the displacements and stresses that will occur in the soil and structure. Problems of particular interest include: slope failures; design of earth dams, retaining walls, and piled structures; displacement and failure of soil under buildings, and determination of soil properties on the surface of the moon and other planets. (USBR)
W70-04631

EFFECTS OF REMOLDING ON THE PROPERTIES OF A LATERITIC SOIL,
Oklahoma State Univ., Stillwater.
Frank C. Townsend, Phillip G. Manke, and James V. Parcher.
Highw Res Rec, No 284, p 76-84, 1969. 9 p, 2 fig, 3 tab, 17 ref.

Descriptors: *Laterites, *Residual soils, *Soil properties, Mechanical properties, Lime soil mixtures, Soils, Soil asphalt, Soil cement, Soil groups, Soil engineering, Soil formation, Soil strength, Soil mechanics, Soil tests, Soil physical properties, Soil stabilization, Soil structure, Bibliographies, Soil types, Test procedures.
Identifiers: Panama, Soil characteristics, Soil deposits, Soil development, Soil recompaction.

Engineering characteristics of a Panamanian lateritic soil were studied and the suitability of various stabilizing additives was investigated. Remolding by mechanical agents altered the physical properties and strength parameters of the soil. Grain size analysis and Atterberg limits tests show that remolding causes a breakdown of the granular structure and an increase in the plasticity of the soil. The efficacy of various stabilizing additives using worked and unworked soil samples was investigated. Stabilization is influenced by the amount of mechanical working. Portland cement was the most effective of the 3 additives tested and yielded higher unconfined compressive strengths with the unworked soil. Lime was also an effective stabilizer, but reacted more favorably with the soil in the worked condition. The primary benefit derived from asphaltic stabilization was waterproofing rather than substantial strength gains. A substantial portion of the clay particles was coated with iron and aluminum oxide (sesquioxide) films, and working by mechanical agents caused a breakdown of this coating allowing the clay particles to behave in a more characteristic fashion. (USBR)
W70-04632

A DROP HAMMER PENETROMETER FOR DETERMINING THE DENSITY OF SOILS AND GRANULAR MATERIALS,
Clemson Univ., S.C.
Joseph P. Rostron, Arnold E. Schwartz, and Thomas E. Gioliosa.
Highw Res Rec, No 284, p 70-75, 1969. 6 O, 5 fig, 2 tab, 7 ref.

Descriptors: *Penetrometers, *Soil density, *Soil tests, Penetration resistance, Penetration tests, Soil moisture, Soil engineering, Soil mechanics, Soil properties, Calibrations, Compacted soils, Soil physical properties, Field tests, Fine-textured soils, Granular materials, Test procedures, Moisture content.
Identifiers: *Testing equipment, Accuracy, Construction control, Correlation.

The possible application of a drop hammer penetrometer to determine the density of soils was investigated. The penetrometer was designed to use a measured number of blows for a certain depth of penetration along with the use of a surcharge. For a given moisture content, a straight-line relationship was found between dry density and penetration resistance for the fine and granular materials tested. For field application of the drop hammer penetrometer, each soil must be calibrated for moisture sensitivity and penetration resistance characteristics. Because of possible thixotropic behavior, time lag between compaction and penetration readings should be kept to a minimum. The overall standard error of the procedure for all materials tested was 2.2 pcf. Total time required to determine the density of a calibrated soil using the penetrometer and the speedy moisture tester was approximately 15 min. (USBR)
W70-04633

PRESSUREMETER CORRELATION STUDY,
Louisiana Dept. of Highways, Baton Rouge.
C. M. Higgins.
Highw Res Rec, No 284, p. 51-62, 1969. 12 p, 10 fig, 19 ref.

Descriptors: *Shear strength, *Soil tests, *Cohesive soils, Shear tests, Soil compression tests, Soil engineering, Soil mechanics, Soil properties, Soil strength, Unconfined compression, Test procedures, Apparatus, Bibliographies.
Identifiers: *Menard pressuremeter, *Comparative studies, Pressure probes, Correlation, In situ tests, Testing equipment.

Shear strengths of cohesive soils obtained in place in boreholes using the Menard pressuremeter system are compared to strengths obtained by unconfined compression tests and by consolidated undrained triaxial tests. Correlation was good for soft, fairly uniform soils, but the pressuremeter showed consistently higher strengths in soils interspersed with materials different from the majority of the material and in soils with other types of discontinuity. The pressuremeter yields a strength prediction between that of the majority of the material and that of the weaker areas in the sample. Conventional test strengths probably are those of the weakest areas in the cores. Advantages of the pressuremeter are: (1) portability; (2) performs the test in place, causing less disturbance to the tested material; and (3) faster and somewhat more economical use. Disadvantages are: (1) extreme sensitivity to hole size, (2) sharp aggregates within the sample may burst the probe, and (3) special methods probably will be required for noncohesive soils. Pressuremeter-derived strengths are closer to the average confined in-place strength of the soils than those obtained by conventional methods. (USBR)
W70-04634

DEVELOPMENT OF A HIGH-VELOCITY IMPACT TEST FOR LABORATORY COMPACTION OF GRANULAR MATERIALS,
Indiana State Highway Commission.
R. P. Dove, T. G. Williamson, and H. R. J. Walsh.
Highw Res Rec, No 284, p 37-50, 1969. 14 p, 9 fig, 1 tab, 7 ref.

Descriptors: *Compaction tests, *Laboratory tests, *Granular materials, *Impact tests, Laboratory equipment, Test procedures, Cohesionless soils, Soil tests, Soil density, Soil compaction, Soil engineering, Soil mechanics, Moisture content, Construction materials, Apparatus, Materials testing, Optimum moisture content.
Identifiers: *Testing equipment, *Construction control, Comparative studies, Vibratory compaction, Equipment design, Correlation.

Development of apparatus and procedures for a laboratory compaction test aimed at simulating field compaction of granular materials is described. The technique includes: (1) use of larger molds (6 in. dia by 9 in. high) and utilization of all sizes of aggregate (up to 1-1/2 in.) commonly used in Indiana for base and subbase materials; (2) compaction in one layer (similar to a field lift) approximately 9 in. in original thickness and 6 in. when compacted; (3) a head plate that covers the entire sample surface; and (4) compaction by impacts from a vibratory shaker and by standard drop hammers. Moisture-density curves obtained on Indiana granular base and subbase materials are compared to curves from Standard and Modified AASHO methods, and certain problems of technique are discussed. Relatively steep compaction curves are obtained using the method and maximum density values can be determined accurately. (USBR)

GEOLOGICAL INFLUENCES ON THE STABILITY OF CLAY SHALE SLOPES,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
E. L. Krinitzsky, and Charles R. Kolb.
Proc 7th Annu Eng Geol Soils Eng Symp, p 160-175, Moscow, Idaho, Apr 1969. 16 p, 9 fig, 16 ref.

Descriptors: *Engineering, *Slope stability, *Clay shales, Geology, Effects, Stability, Soil mechanics, Structural relaxation, Slopes, Precipitation (Atmospheric), Bibliographies, Weathering, Groundwater, Landslides, Erosion, Shales, Topography, Mineralogy, Structure.
Identifiers: Geologic defects, Sliding resistance, Rock slope.

Influences of lithology, erosion, structural relaxation, weathering, local topography, precipitation and ground water, rock structure, and rock fabric on the stability of clay shale slopes are discussed. Stability is determined by combinations of these factors; the importance of each can vary over short distances. Major influences are the various aspects of lithology, structure, and ground water. Several examples of landslides are cited. (USBR)

8F. Concrete

RECOMMENDATIONS FOR TESTING CONCRETE BY THE ULTRASONIC PULSE METHOD,
R. Jones, and I. Facaoaru.
Mater Struct, Vol 2, No 10, p 275-284, July-Aug, 1969. 10 p, 5 fig, 5 tab.

Descriptors: Concrete construction, Concrete control, Concretes, Wave velocity, Concrete structures, Concrete technology, *Concrete testing, *Ultrasonics, Elasticity modules, Elasticity (Mechanical), Poisson ratio, Compressive strength, Instrumentation, Measuring instruments.
Identifiers: *Concrete properties, Foreign testing, Great Britain, *Ultrasonic impulse method, Soniscopes, *Pulse velocity tests.

Recommendations are given for application of the ultrasonic pulse method to determine elastic properties, strength, homogeneity, location of internal defects, and changes in concrete properties. Methods of measuring pulse velocity and influence of test conditions on accuracy are discussed. The recommended procedures should lead to better standardization of measuring techniques. Interpretation difficulties arise in deriving elastic properties and strength from in situ measurements of pulse velocity, but may be overcome by following the recommended methods. (USBR)
W70-04620

RECOMMENDATIONS FOR THE USE OF RESONANCE METHODS FOR TESTING CONCRETE,
Institute for Building Technics, Warsaw (Poland).
L. Brunarski.
Mater Struct, Vol 2, No 10, p 269-273, July-Aug, 1969. 5 p, 6 tab.

Descriptors: Vibrations, *Non-destructive tests, Instrumentation, Test procedures, Test specimens, Testing, Transverse waves, Longitudinal waves, Elasticity (Mechanical), *Elasticity modulus, *Concrete testing, Concretes, Concrete technology, *Natural frequency, Materials testing.
Identifiers: *Resonance frequency method, Foreign testing, *Torsional resonant frequency, *Rigidity modulus.

Recommendations on resonance frequency methods for testing concrete, accepted at the RILEM Working Group Meeting on Nondestructive Testing of Concrete held at Varna, Bulgaria, in Sept 1968, are presented. The recommendations were developed by members of Working Groups from Czechoslovakia, Japan, Poland, Soviet Union, United Kingdom, and United States. Specific recommendations are given for: apparatus characteristics; shape, dimensions, curing conditions, and age of test specimens; specimen support and positioning of driver and pickup for longitudinal, flexural, and torsional modes of vibration; formulas for calculating dynamic elasticity moduli; and symbols and units in SI and MKfs systems. (USBR)

ABNORMAL SET OF PORTLAND CEMENT - CAUSES AND CORRECTIVES,
Bureau of Reclamation, Denver, Colo.
G. L. Kalousek.
Bur Reclam General Rep 45, REC-OCE-69-2, Nov 1969. 23 p, 8 fig, 5 tab, append.

Descriptors: *Portland cements, *Concrete technology, *Gypsum, *Concrete additives, *Crystallization, *False set, Hydrates, Differential thermal analysis, Cements, Thixotropy, Hardening, Setting (Materials).
Identifiers: Ettringite, Cement hydration, Cement chemistry, Glossaries.

Abnormal set of portland cement may be due to different combinations of several causes. Gypsum recrystallization was confirmed as one cause. The rate of ettringite precipitation of certain cements treated with organic admixtures correlated with the rate of stiffening of the mortars. Thixotropic set was determinable on cement-benzene slurries with a thixometer, an instrument developed for the purpose. Thixotropic behavior was induced by aeration at 50% R H and persisted in cement-water pastes from about 10 sec to over 11 min. The rate of gypsum and ettringite formation was followed by differential thermal analysis. The causes of and correctives for abnormal set are described. (USBR)
W70-04627

CONCRETE PERFORMANCE IN YELLOWTAIL DAM, MONTANT--5-YEAR CORE REPORT,
Bureau of Reclamation, Denver, Colo.
J. R. Graham.
Bur Reclam Rep C-1321, Oct 1969. 40 p, 20 fig, 14 tab, 2 ref, append.

Descriptors: *Concrete testing, *Mass concrete, Concretes, Compressive strength, Poisson ratio, Concrete control, Elasticity modulus, Concrete dams, Laboratory tests, Concrete technology, Cores, Construction joints, Concrete mixes, Aging (Physical), Physical properties.
Identifiers: Concrete properties, Yellowtail Dam (Mont), Longtime tests.

Laboratory physical properties tests were performed on 10-in.-dia cores drilled from mass concrete in Yellowtail Dam, Mont. Strength and elastic properties were determined on the concrete specimens at 6-mo, 1-, and 5-yr ages. Results indicate a well-designed, properly consolidated, good-quality concrete. The study is part of a series in the Bureau of Reclamation's 20-yr evaluation of strength and elastic properties, of concrete in various dams. Some findings based on tests of the cores are: (1) strength development continued to 5-yr age; (2) vertically drilled cores exhibited higher compressive strengths than cores drilled horizontally; (3) modulus of elasticity increased somewhat to 5-yr age; and (4) wet-sandblast-prepared construction joints are better than those prepared by water jetting. Cement efficiencies, coefficient of variation of strengths, and other properties are discussed. (USBR)
W70-04628

PRECAST CONCRETE UNITS USED AS FORMS FOR CAST-IN-PLACE CONCRETE,
American Concrete Inst., Detroit, Mich.
William R. Waugh, Martin W. Boll, and George F. Bowden.
Amer Concr Inst J Proc, Vol 66, No 10, p 798-813, Oct 1969. 16 p, 12 fig, 32 ref.

Descriptors: *Concrete construction, *Precast concrete, *Formwork (Construction), Architecture, Concretes, Bonding, Bridges, Mass concrete, Buildings, Concrete technology, Floors, Bibliographies, Concrete dams, Hydraulic structures, Joints (Connections), Reinforced concrete, Roofs, Structural design, Prestressed concrete, Walls.
Identifiers: Bond, Concrete blocks.

Precast concrete units, unreinforced, reinforced, or prestressed, are used as forms for cast-in-place and precast concrete. Precast units as forms for cast-in-place and precast concrete. Precast units as forms for cast-in-place work are discussed, showing how such units are used: (1) as structurally adequate for applied loads and concrete pressures without support except ties and alinement braces, or (2) as liners for forms made of other materials. The concrete forms may be removed after casting or remain in place as a permanent part of the structure. A principal application of stay-in-place forms has been as architectural facing, but some become structurally composite with the cast-in-place concrete. Development of various types of precast forms including ferrocement and facing slabs for mass concrete and hydraulic structures is surveyed, but the main concentration is on structural and architectural uses most prevalent in the U.S. and Canada. Typical formwork installations are described, and factors influencing use are discussed. Design and construction requirements for this type of formwork are outlined and suggestions for handling, erection, and use of precast forms are made. Recommendations are given for treatment of joint and connection details and for bond and anchorage of the form units. (USBR)

LARGE AGGREGATE SHOTCRETE CHALLENGES STEEL RIBS AS A TUNNEL SUPPORT,
Bechtel Corp., San Francisco, Calif.
Harry Sutcliffe, and Cole R. McClure.
Civ Eng, Vol 39, No 11, p. 51-55, Nov 1969. 5 p, 3 fig, 3 photo.

Descriptors: *Tunnel linings, *Gunite, *Pumped concrete, *Tunnel construction, Construction, Tunneling, Creep, Aggregates, Compressed air, Accelerators, Reinforcing, Underground structures, Axial loads, Durability.
Identifiers: *Tunnel supports, *Sprayed concrete, *Concrete linings, Compressive stress.

A growing need for underground construction exists in transportation, pumped storage, pollution control, and defense works. The rate of growth of tunnel construction is limited only by the higher cost when compared with above-ground construction. A substantial portion of the cost of underground work is in the support and lining of the excavation, and making this area more economical is important. Any acceleration of the rate that support or lining can be placed permits the use of faster tunneling machines and reduces costs. Gunite, a pneumatically applied cement mortar used in canal linings, has been used with wire-mesh reinforcement in tunnels to prevent slaking and spalling

of the ground, with good durability and resistance to abuse. The spraying of large-aggregate concrete was only mildly successful until European research with chemical accelerators provided a means of controlling the rate of strength buildup of the sprayed material. Use of accelerators started the changes in application practices and furthered the acceptance of shotcrete in underground work. First used in combination with steel ribs and wire mesh shotcrete is used more frequently unreinforced. (USBR)

COMPARISON OF CHEMICALLY AND ELECTROLYTICALLY INDUCED PITTING CORROSION,
General Motors Corp., Warren, Mich. Dept. of Chemistry; and Connecticut Univ., Storrs. Corrosion Research Lab.
W. D. France, Jr., and N. D. Greene.
Corrosion, Vol 26, No 1, p 1-4, January 1970. 4 p, 5 fig, 1 tab, 19 ref. OSW Grant No 14-01-0001-458.

Descriptors: *Pitting (Corrosion), *Corrosion, *Brines, *Desalination apparatus, *Stainless steel, Saline water, Saline water systems, Water chemistry, Chemical reactions, Electrolysis, Metallurgy, Corrosion control.
Identifiers: Zirconium.

Studies of pitting of zirconium and stainless steel in acidic and near-neutral chloride media show that controlled potential and conventional chemical corrosion tests do not yield similar rates or types of attack under identical environmental conditions. Such discrepancies limit critical pitting potential measurements and related techniques for evaluating and comparing pitting in halide environments like those in desalination equipment. A theoretical explanation based on the accumulation of chloride at anodically polarized electrode surfaces is presented. (Knapp-USGS)

THE APPLICATION OF A DIGITAL COMPUTER TO MECHANICAL TESTING,
Union Carbide Corp., Oak Ridge, Tenn.
James H. Smith.
Exp Mech, Vol 9, No 11, p 23N-28N, Nov, 1969. 6 p, 12 fig.

Descriptors: *Digital computers, Computer programming, Computers, Data processing, Data reduction, Experimental data, *Materials testing, Mechanical properties, *Metals testing, Laboratory tests, Testing, Testing machines, Stress-strain curves, Computation.
Identifiers: Analog-to-digital converter, Display systems, *Testing equipment, Test results, Strain energy, Computer printouts.

A digital computer may be programmed to record raw data and to provide automatic data calculations for mechanical tests. An evaluation is given of a computer system connected to a universal testing machine and a torsion tester. The computer is connected to the testing machines by an analog-digital converter. The system records raw load-strain data, converts to stress-strain data, and calculates any mechanical properties desired from the test. The computer also can provide a printout and a paper tape of the data. An oscilloscope display is obtained as data are recorded. Tensile, compression, pin bearing, double shear, and torsion tests are being performed. Data being recorded include ultimate strength, offset yield strength, elastic and shear moduli, energy under the stress-strain curve, and a mathematical expression for the stress-strain curve. In addition to the mechanical load-strain curve provided by the test machine, the computer can provide a stress-strain curve and a listing of stress-strain data points. (USBR)

MEASURING MOISTURE WITH GAMMA RADIATION,
F. E. McKinney.
Isotop Radiat Technol, Vol 7, No 1, p. 29-35, Fall 1969. 7 p, 7 fig, 2 tab, 23 ref.

Descriptors: *Gamma rays, *Moisture content, *Moisture meters, *Nuclear moisture, *Soil moisture, Moisture, Bibliographies, Reviews, Density, Radioisotopes, Ceramic materials, Radioactivity techniques, Cobalt radioisotopes, Soils, Soil moisture, Peat, Cements, Wood, Textiles, Fibers, Materials, Test procedures, Soil mechanics.
Identifiers: *Gamma probes, *Nuclear density meters, *Water content, Cesium radioisotopes.

Determining the amount of moisture in a given substance is a necessary part of many physical and chemical processes. Neutron moisture gages are used for this purpose, based upon the moderation of neutron by hydrogen. However, many substances have hydrogen as part of their chemical composition and neutron measurements would be in error for these materials. Gamma radiation may be used for an indirect determination of moisture content; gamma radiation is used to measure the densities of a dry sample and a moist sample, and moisture is determined with the assumption that the difference in densities is the result of the difference in water content. Applications of gamma radiation to determine the moisture content in soil, peat, wood, ceramics, construction materials, meat, and textile fibers are reviewed. The source isotopes were Cobalt 60 and Cesium 137 used at strengths of 1 mc to 10 curies of Cobalt 60, and 5 mc to 251 mc of Cesium 137. (USBR)
W70-04641

CORROSION RESISTANCE OF TITANIUM AND ITS ALLOYS IN PRIMARY WATER AND HOT BRINE ENVIRONMENTS,
Titanium Metals Corp. of America, West Caldwell, N.J.
N. G. Feige.
Preprint SM-113/25 of Paper Presented at IAEA Symp. Nucl. Desalination, Madrid, Spain, Nov. 18-22, 1968. 20 p, 7 fig, 16 ref.
Identifiers: *Corrosion tests, *Titanium, *Titanium alloys, Corrosion, Corrosion control, Corrosion problems, Crevice corrosion, Fabrication materials, Heat transfer, Pitting (Corrosion), Tubing (Metal).

A review of corrosion evaluation studies and subsequent alloy development program has resulted in a series of titanium base alloys suitable for service at temperatures up to 350 deg F. A critical area in a nuclear desalination plant is the interface between the primary water or steam in the nuclear system and the hot concentrated brine in the desalting plant. Titanium, because of its compatibility with both environments, has been considered in these heat exchangers to reduce the probability of tube failure. In the nuclear system under primary water conditions titanium appears to suffer no corrosion attack other than the buildup of an adherent oxide tarnish film. In the hot brine environment pitting corrosion or crevice corrosion at elevated temperatures limits a commercially pure alloy as heat exchanger tubing to service below 250 deg F. The laboratory experimental techniques developed during this program are reviewed. The information obtained from each test is related to the mechanism of corrosion attack, and the available alloy additions and their effect in modifying the rates of reaction are reviewed. Field service experience with titanium is reviewed and related to the laboratory test program.

ALLOY SELECTION FOR HEAT-EXCHANGER SERVICE IN SEAWATER-CONVERSION PLANTS,
Battelle Memorial Inst., Columbus, Ohio.
F. W. Fink.
Copper Develop. Assoc. Tech. Rept. 704/6, June, 1966. 38 p, 37 ref.
Identifiers: *Corrosion, *Fabrication materials, *Heat exchangers, Aluminum, Copper, Copper alloys, Stainless steels, Titanium.

Copper alloys have long been used for heat exchangers in applications involving seawater since they have a unique combination of properties which make them an excellent choice for this service. One of the oldest of these alloys, arsenical admiralty (copper alloy no. 443), still can be useful in the less severe, lower temperature stages of a multieffect distillation plant. Arsenical aluminum brass (copper alloy no. 687) has shown excellent performance in hot seawater applications and is widely used. However, for the higher temperature stages in some of newer plants the copper nickels are preferred. Many designers favor the iron-modified 90-10 copper nickel (copper alloy no. 706), since it is superior to the aluminum brass in performance, and is less costly than the iron-modified 70-30 copper nickel (copper alloy no. 715). The higher nickel content alloy is favored where the severe service conditions are beyond the range of presently available information. Quantitative long-term corrosion data for copper alloys are urgently needed. Present information comes from limited experience with pilot or demonstration plants or from spool-test-type specimens immersed in the seawater streams of such plants.
W70-04929

TITANIUM TUBES NOW FIGHT SEA WATER,
Harvey Aluminum, St. Croix, Virgin Islands.
M. H. Sims.
Power, Vol. 112, No 9, p 63-65, 1968. 5 fig.
Identifiers: *Corrosion, *Heater-evaporator tubes, *Operating experience, *Titanium, Corrosion control, Crevice corrosion, Erosion corrosion, Evaporators, Fabrication materials, Tubing (Metal).

After 2 years of continuous operation the titanium tubing in the multistage flash distillation plant at St. Croix, V.I., shows no sign of tube erosion or crevice corrosion. The plant was constructed by Westinghouse for Harvey Aluminum to produce 0.75 MGD at 185 deg F or 1.5 MGD at 250 deg F. The plant has 0.028-in.-thick tubes, 5.8-in.-dia in the evaporator and 1-in.-dia in the heat reject and heat recovery sections. The plant has been operating at 220-250 deg F with an output of 1 MGD. No scaling problems have been encountered - on-stream avid cleaning of the tubes was used when some tube fouling was indicated.

CORROSION OF MILD STEEL UNDER OPERATING CONDITIONS OF A DISTILLATION DESALTING PLANT.

Desalination Vol 5, p 90-94, 1968. 4 fig. Also Preprint from 2d European Symp.-Fresh Water From The Sea, Vol 4, Athens, May, 1967.
Identifiers: *Corrosion, *Fabrication materials, *Low alloy steels, Corrosion tests, Deaeration, Experimental data, Research results.

The influence of temperature, salinity, chloride, sulfate, and seawater velocity on the corrosion resistance of mild steel was investigated to determine the possibilities of its application to desalting plants. The maximum corrosion of mild steel in caspian seawater under static conditions is 0 to 15 MM/YR (at 90 deg C) and with flow at a velocity of 1 to 2 M/SEC is 1 to 25 MM/YR (at 70 deg C). The corrosion rate of mild steel decreases abruptly in oxygen-free seawater under static conditions and is not higher than 0 to 0.01 MM/YR at 90 deg C. If mild steel is in contact with copper-base alloys or stainless steel, corrosion increases greatly. Maximum corrosion of mild steel in contact with electropositive materials in moving seawater is 2 to 3 MM/YR at 70 deg C. On the basis of these results, mild steel is recommended as a construction material for distillation plants if the seawater is deaerated and there is no contact with electropositive materials.

RESOURCE CONSERVATION GLOSSARY,
D. E. Hutchinson, and A. D. Stoesz.
Journal of Soil and Water Conservation, Vol 25, No 1, p 1G-52G, January-February 1970. 52 p, 30 ref.

Descriptors: *Publications, *Documentation, *Soil conservation, *Water conservation, Geology, Hydrology, Biology, Forestry, Economics, Ecology, Agronomy, Conservation, Engineering, Recreation, Ranges, Soils, Watershed management.
Identifiers: *Glossaries.

A glossary of resource conservation includes terms used in studies of agronomy, biology, conservation, ecology, economics, engineering, forestry, geology, hydrology, ranges, recreation, soils, and watersheds. The glossary is intended to serve as a reference for professionals, students, and laymen. (Knapp-USGS)

Available from the Clearinghouse as PB-190 398, $3.00 in paper copy, $0.65 in microfiche. Supplement of Report prepared for Office of Water Resources Research, Department of Interior, 1970. 13 p, 21 ref. OWRR Contract No 14-01-0001-1618.

Descriptors: *Publications, *Reviews, Water law, Social aspects, Planning, Surveys, Documentation, Editing, Technical societies, Water resources development.
Identifiers: *Water resources information, Information exchange.

The use and availability of water resources information to professionals in law, planning, and sociology is surveyed. Several of the most widely circulated periodicals in each of the disciplines under consideration were examined for the years 1965-1969 to ascertain what the readers of these publications could have learned from them concerning water resources problems. None of the publications examined has devoted a great deal of attention to water resources. If increased attention to water resources is to be stimulated beyond what may occur in any event, there must be an understanding of the audience to be reached and of the purposes that publications for the nonspecialist may be expected to serve. A significant part of the responsibility for disseminating technical information to experts in other disciplines should be assumed by persons other than those who initially do the research and write the monographs setting forth their findings. GEOLOGY AND GROUNDWATER RESOURCES OF LINN COUNTY, KANSAS,
W70-04732 02F

KAPLAN TURBINES
30 YEARS OF MAINTENANCE EXPERIENCE WITH LARGE KAPLAN TURBINES,
W70-04646 08C

KINETIC MODELS
KINETICS OF BIOLOGICAL TREATMENT,
W70-04785 05D

KINETICS
KINETICS OF ADSORPTION BY ACTIVATED CARBON FROM DILUTE AQUEOUS SOLUTION,
W70-04798 05D

KINETICS(WASTE TREATMENT)
ANAEROBIC TREATMENT OF SOLUBLE WASTES,
W70-04783 05D

LABORATORY DATA EXTRAPOLATIONS
INDUSTRIAL WASTE TREATMENT IN AERATED LAGOONS,
W70-04781 05D

LABORATORY TESTS
DEVELOPMENT OF A HIGH-VELOCITY IMPACT TEST FOR LABORATORY COMPACTION OF GRANULAR MATERIALS,
W70-04635 08D

MATHEMATICAL MODELING OF MIXING PHENOMENA IN RIVERS,
W70-04770 05D

INDUSTRIAL WASTE TREATMENT IN AERATED LAGOONS,
W70-04781 05D

DISPOSAL OF BRINE BY SOLAR EVAPORATION LABORATORY EXPERIMENTS,
W70-04891 05E

LABORATORY-SCALE STUDIES
AMMONIA REMOVAL FROM SECONDARY EFFLUENTS BY SELECTIVE ION EXCHANGE,
W70-04804 05D

LAGOONS
STABILIZATION PONDS IN THE CANNING INDUSTRY,
W70-04792 05D

PILOT INVESTIGATION OF STARCH-GLUTEN WASTE TREATMENT,
W70-04803 05D

ESTUARIES ANALYSIS OF DEFINITIONS AND BIOLOGICAL CONSIDERATIONS,
W70-05015 02L

ESTUARIES AND LAGOONS IN RELATION TO CONTINENTAL SHELVES,
W70-05016 02L

LAKE BALATON (HUNGARY)
CHANGES OF THE WATER LEVEL OF LAKE BALATON FROM THE NEOLITHIC AGE UP TO THE PRESENT TIME,
W70-04755 02H

LAKE BASINS
LAGOON LEVELING TO PERMIT ANNUAL CROPPING IN SEMIARID AREAS,
W70-04555 04A

LAKE MENDOTA(WIS)
SOME OBSERVATIONS OF CURRENTS IN THE HYPOLIMNION OF LAKE MENDOTA,
W70-04812 02H

LAKE MICHIGAN
STRONTIUM-90 FALLOUT OVER LAKE MICHIGAN,
W70-04705 05B

TO PREVENT AN UNNATURAL DEATH.
W70-04898 05C

BACKGROUND MATERIAL COVERING THE FEASIBILITY OF CREATING ISLANDS IN LAKE MICHIGAN NEAR CHICAGO,
W70-04899 06B

LAKE NASSER
ASSESSMENT OF ATMOSPHERIC EFFECTS OF LAKE NASSER.
W70-04756 02B

LAKE ONTARIO
YIELDS AND SOURCES OF NITROGEN FROM SEVERAL LAKE ONTARIO WATERSHEDS,
W70-04979 05B

LAKE STAGES
HISTORY OF LAKES ON THE YOUNG-GLACIAL AREAS OF THE NORTH-EASTERN POLAND,
W70-04754 02H

LAKES
AN ECOLOGICAL HISTORY OF THE LAKE VICTORIA BASIN,
W70-04597 02H

LAKE EUTROPHICATION -- A NATURAL PROCESS,
W70-04721 05C

HISTORY OF LAKES ON THE YOUNG-GLACIAL AREAS OF THE NORTH-EASTERN POLAND,
W70-04754 02H

CHANGES OF THE WATER LEVEL OF LAKE BALATON FROM THE NEOLITHIC AGE UP TO THE PRESENT TIME,
W70-04755 02H

ASSESSMENT OF ATMOSPHERIC EFFECTS OF LAKE NASSER.
W70-04756 02B

SOME METHODOLOGICAL PROBLEMS OF INVENTORIES ON LAKES,
W70-04757 02H

ON WATER BUDGET LAKE CLASSIFICATION,
W70-04758 02H

BIOLOGICAL RESPONSES TO NUTRIENTS-EUTROPHICATION PROBLEMS IN FRESHWATER,
W70-04765 05D

SOME OBSERVATIONS OF CURRENTS IN THE HYPOLIMNION OF LAKE MENDOTA,
W70-04812 02H

SHORELAND CORRIDOR REGULATIONS TO PROTECT LAKES,
W70-04820 02H

HISTORY OF THE DEVELOPMENT OF LAKE ISSYK-KUL. (IN FRENCH),
W70-05021 02H

LAMINAR FLOW
DEFINED VELOCITY GRADIENT MODEL FLOCCULATOR,
W70-04802 05D

EXACT SIMILAR SOLUTION OF THE LAMINAR BOUNDARY-LAYER EQUATIONS,
W70-05040 08B

LAND FORMING
LAGOON LEVELING TO PERMIT ANNUAL CROPPING IN SEMIARID AREAS,
W70-04555 04A

LAND MANAGEMENT
LAGOON LEVELING TO PERMIT ANNUAL CROPPING IN SEMIARID AREAS,
W70-04555 04A

EFFECTS OF CONSERVATION TREATMENTS ON WATER YIELD,
W70-04730 03F

LAND RECLAMATION
LAGOON LEVELING TO PERMIT ANNUAL CROPPING IN SEMIARID AREAS,
W70-04555 04A

THE IJSSEL LAKE AS A MULTI-PURPOSE RESERVOIR,
W70-05027 08A

LAND SUBSIDENCE
LAND SUBSIDENCE RELATED TO GROUNDWATER OFFTAKE IN THE NEW ORLEANS AREA,
W70-04833 04B

GEOLOGICAL SUBSIDENCE,
W70-04908 02F

LAND USE
AN INVENTORY OF THE PONDS, LAKES, AND RESERVOIRS OF MASSACHUSETTS-BARNSTABLE COUNTY,
W70-04651 07C

SHORELAND CORRIDOR REGULATIONS TO PROTECT LAKES,
W70-04820 02H

LANDFILLS
LEACHING OF POLLUTANTS FROM REFUSE BEDS,
W70-04714 05A

LATERITES
EFFECTS OF REMOLDING ON THE PROPERTIES OF A LATERITIC SOIL,
W70-04632 08D

LEACHING
MIGRATION OF POLIOVIRUS TYPE 2 IN PERCOLATING WATER THROUGH SELECTED OAHU SOILS,
W70-04688 05G

LEACHING OF POLLUTANTS FROM REFUSE BEDS,
W70-04714 05A

LEAF TEMPERATURE
DIURNAL VARIATION IN LEAF AND BOLL TEMPERATURES OF IRRIGATED COTTON GROWN UNDER TWO SOIL MOISTURE REGIMES IN A SEMI-ARID CLIMATE,
W70-04912 02I

LEGISLATION
TEXTILE WORKS EFFLUENT TREATMENT,
W70-04831 05D

INDIANA WATER LAW AND SUGGESTIONS FOR ACTION,
W70-04857 06E

W70-04867 06E

REPORT OF THE SELECT COMMITTEE ON WATER RESOURCES (FLORIDA'S WATER PROBLEMS).

REPORT OF THE SELECT COMMITTEE ON WATER RESOURCES (FOREIGN MATTER AND SALT WATER INTRUSION IN PUBLIC WATERS).
W70-04883 05G

REPORT OF THE SELECT COMMITTEE ON WATER RESOURCES, (FLOOD PLAIN AREAS AND WATER STORAGE LANDS).
W70-04884 05G

REPORT OF THE SELECT COMMITTEE ON WATER RESOURCES (PROPOSED STATUTES).
W70-04886 05G

LEGAL AND PRACTICAL PROBLEMS OF EFFLUENT DISPOSAL,
W70-04976 05D

LEGISLATIVE REPORTS
INDIANA WATER LAW AND SUGGESTIONS FOR ACTION,
W70-04857 06E

LIME
MATHEMATICAL MODEL OF TERTIARY TREATMENT BY LIME ADDITION,
W70-04547 05D

LIME CLARIFICATION, RECOVERY, REUSE, AND SLUDGE DEWATERING CHARACTERISTICS,
W70-04801 05D

LIME RECOVERY
LIME CLARIFICATION, RECOVERY, REUSE, AND SLUDGE DEWATERING CHARACTERISTICS,
W70-04801 05D

LIME REUSE
LIME CLARIFICATION, RECOVERY, REUSE, AND SLUDGE DEWATERING CHARACTERISTICS,
W70-04801 05D

LIMESTONES
THE GROUNDWATER HYDROLOGY OF THE LINCOLNSHIRE LIMESTONE,
W70-04733 02F

LIMNOLOGY
ON WATER BUDGET LAKE CLASSIFICATION,
W70-04758 02H

LINEAR PROGRAMMING
MARKOV MODELS FOR FLOW REGULATION,
W70-04987 06A

LIQUID FILM COEFFICIENT
NEW CONCEPTS IN OXYGEN TRANSFER AND AERATION,
W70-04777 05D

LIQUID LAMINAR JET SYSTEM
MECHANISM OF INTERFERENCE OF SURFACE ACTIVE AGENTS IN AERATION SYSTEMS,
W70-04779 05D

LITTORAL DRIFT
QUANTITATIVE RESEARCH ON LITTORAL DRIFT AND TIDAL INLETS,
W70-05011 02L

LIVESTOCK MANURE CHARACTERISTICS
WASTE STABILIZATION PONDS FOR AGRICULTURAL WASTES,
W70-04791 05D

LOADING
FACTORS TO BE CONSIDERED IN THE DESIGN OF ACTIVATED SLUDGE PLANTS,
W70-04775 05D

LOCAL GOVERNMENTS
INDIANA WATER LAW AND SUGGESTIONS FOR ACTION,
W70-04869 06E

LOESS
HYDROLOGIC SYSTEM RELATED TO GEOLOGY AND SOILS, FOUR MILE CREEK AREA, TAMA COUNTY, IOWA,
W70-04545 02E

LONGITUDINAL MIXING
FACTORS TO BE CONSIDERED IN THE DESIGN OF ACTIVATED SLUDGE

PLANTS,
W70-04775 05D

LONGITUDINAL MIXING COEFFICIENTS
MATHEMATICAL MODELING OF MIXING PHENOMENA IN RIVERS,
W70-04770 05D

LONG-TERM ECOLOGICAL CHANGES
ECOLOGICAL CHANGES IN A POLLUTED ENVIRONMENT.
W70-04763 05D

LOUISIANA
GEOCHEMISTRY OF SOME PETROLEUM-ASSOCIATED WATERS FROM LOUISIANA,
W70-04710 02K

NOTES ON ESTUARINE POLLUTION WITH EMPHASIS ON THE LOUISANA GULF COAST,
W70-05006 05B

LOW ALLOY STEELS
CORROSION OF MILD STEEL UNDER OPERATING CONDITIONS OF A DISTILLATION DESALTING PLANT.
W70-04949 08G

LOWER SABINE RIVER(TEXAS)
BOTTOM FAUNA STUDIES OF THE LOWER SABINE RIVER,
W70-04808 05G

LOW-QUALITY WATER TREATMENT
WATER RESOURCES VALUES,
W70-04762 05D

LOW-SOLIDS PRODUCTION
INDUSTRIAL WASTE TREATMENT IN AERATED LAGOONS,
W70-04781 05D

LYSIMETERS
WATER TRANSFER FROM SOIL TO THE ATMOSPHERE AS RELATED TO CLIMATE AND SOIL PROPERTIES,
W70-04685 02G

MACROPHYTES
INTERACTIONS BETWEEN THE RATES OF PRODUCTION OF A FRESHWATER MACROPHYTE AND PHYTOPLANKTON IN A POND,
W70-04818 02H

MAINTENANCE
30 YEARS OF MAINTENANCE EXPERIENCE WITH LARGE KAPLAN TURBINES,
W70-04646 08C

MANAGEMENT
ALTERNATIVE INSTITUTIONAL ARRANGEMENTS FOR MANAGING RIVER BASIN OPERATIONS.
W70-04834 06B

ENVIRONMENTAL PLANNING WITH SPECIAL RELATIONS TO NATURAL RESOURCES,
W70-04847 06B

MANAGING THE GREAT LAKES WATER RESOURCE,
W70-04848 06B

MANGANESE
CHEMISTRY OF MANGANESE IN NATURAL WATERS,
W70-04558 02K

MANGANESE SAMPLING
THE MIGRATION OF MANGANESE IN THE ARCTIC BASIN SEDIMENT,
W70-04591 02K

MANNINGS EQUATION
RELATION OF THE MANNING COEFFICIENT TO MEASURED BED ROUGHNESS IN STABLE NATURAL CHANNELS,
W70-04565 02E

MANURE STABILIZATION POND
WASTE STABILIZATION PONDS FOR AGRICULTURAL WASTES,
W70-04791 05D

MARGINAL COSTS
ECONOMIC ASPECTS OF GROUND-WATER BASIN CONTROL,
W70-04650 04B

MARINE ENVIRONMENTS
DISTINCTION BETWEEN BACTERIAL AND ALGAL UTILIZATION OF SOLUBLE SUBSTANCES IN THE SEA,
W70-04811 05C

MARINE MICROORGANISMS
BIOLOGICAL RESPONSES TO NUTRIENTS-EUTROPHICATION SALINE WATER CONSIDERATIONS,
W70-04766 05D

DISTINCTION BETWEEN BACTERIAL AND ALGAL UTILIZATION OF SOLUBLE SUBSTANCES IN THE SEA,
W70-04811 05C

MARKOV PROCESSES
MARKOV MODELS FOR FLOW REGULATION,
W70-04987 06A

MASS BALANCE EQUATION
ANALYSIS OF THE DISSOLVED OXYGEN VARIATION IN A FLOWING STREAM,
W70-04768 05D

MASS CONCRETE
CONCRETE PERFORMANCE IN YELLOWTAIL DAM, MONTANT--5-YEAR CORE REPORT,
W70-04628 08F

MASS TRANSFER
HEAT AND MASS TRANSFER IN TURBULENT BOUNDARY LAYERS,
W70-05037 08B

HEAT TRANSFER-A REVIEW OF CURRENT LITERATURE,
W70-05043 08B

MASS TRANSFER COEFFICIENTS
NEW CONCEPTS IN OXYGEN TRANSFER AND AERATION,
W70-04777 05D

MASS TRASFER
MATHEMATICAL MODELING OF MIXING PHENOMENA IN RIVERS,

PROBABILISTIC RESERVOIR DESIGN,
W70-05031 04A

SINGLE-PURPOSE PLANT
CONCEPTUAL DESIGN STUDIES OF A DUAL-PURPOSE AND A VAPOR-COMPRESSION WATER-ONLY 750-MGD PLANT,
W70-04683 03A

SINGLE-PURPOSE PLANT ECONOMICS
COST OF WATER FROM A SINGLE-PURPOSE MULTISTAGE FLASH PLANT WITH VAPOUR RECOMPRESSION.
W70-04675 03A

SLASHING WASTES
WASTE WATER CONTROL SYMPOSIUM.
W70-04849 05D

SLOPE STABILITY
GEOLOGICAL INFLUENCES ON THE STABILITY OF CLAY SHALE SLOPES,
W70-04644 08D

SLUDGE
LOW TEMPERATURE ACTIVATED SLUDGE SETTLING,
W70-04800 05D

SLUDGE DEWATERABILITY
FACTORS TO BE CONSIDERED IN THE DESIGN OF ACTIVATED SLUDGE PLANTS,
W70-04775 05D

SLUDGE DISPOSAL
NEW DEVELOPMENTS IN ANAEROBIC DIGESTION OF SLUDGES,
W70-04784 05D

TREATMENT STUDIES OF COMBINED TEXTILE AND DOMESTIC WASTES,
W70-04795 05A

SLUDGE LOADS
OBJECTIVES, TECHNOLOGY, AND RESULTS OF NITROGEN AND PHOSPHORUS REMOVAL PROCESSES,
W70-04764 05D

SLUDGE PRODUCTION
FACTORS TO BE CONSIDERED IN THE DESIGN OF ACTIVATED SLUDGE PLANTS,
W70-04775 05D

SLUDGE SETTLEABILITY
FACTORS TO BE CONSIDERED IN THE DESIGN OF ACTIVATED SLUDGE PLANTS,
W70-04775 05D

SLUDGE TREATMENT
NEW DEVELOPMENTS IN ANAEROBIC DIGESTION OF SLUDGES,
W70-04784 05D

DISPOSAL AND CLARIFICATION OF LIQUID WASTES,
W70-04968 05D

SLUDGES
NEW DEVELOPMENTS IN ANAEROBIC DIGESTION OF SLUDGES,
W70-04784 05D

SLUDGE-BLANKET CLARIFIERS
LOW TEMPERATURE ACTIVATED SLUDGE SETTLING,
W70-04800 05D

SLUDGE-LOSS FACTOR
RESEARCH DEVELOPMENTS IN REGARD TO CONCEPT AND BASE VALUES OF THE ACTIVATED SLUDGE SYSTEM,
W70-04772 05D

SMALL WATERSHEDS
EFFECTS OF SMALL STRUCTURES ON PEAK FLOW,
W70-04571 04A

FIELD EXPERIMENT ON WASHITA RIVER,
W70-04572 04D

APPLICATION OF CONTINUOUS ACCOUNTING TECHNIQUES TO EVALUATE THE EFFECTS OF SMALL STRUCTURES ON MUKEWATER CREEK, TEXAS,
W70-04726 04C

THE DISCOUNT RATE IN PUBLIC INVESTMENT EVALUATION - VIEWS FROM THE FEDERAL GOVERNMENT A PANEL DISCUSSION,
W70-04825 06B

EFFECT OF STORM RAINFALL VARIABILITY ON RUNOFF FROM SMALL SEMIARID WATERSHEDS,
W70-04910 02A

SNAKE CREEK PUMPING PLANT(N DAK)
LARGE COMBINED AXIAL- AND MIXED-FLOW PUMP,
W70-04894 08C

SNAPBEANS
IRRIGATING VEGETABLES WITH BRACKISH WATER,
W70-04906 03C

SNOW
FORECASTING SNOW AND RAIN FOR THE NEW YORK CITY AREA USING THE METHOD OF ORDERED STATISTICS,
W70-04720 02B

SOME PHYSICAL PROPERTIES OF ALPINE SNOW,
W70-04739 02C

SNOW COVER
RELATIONSHIPS BETWEEN CLIMATE AND REGIONAL VARIATIONS IN SNOW-COVER DENSITY IN NORTH AMERICA,
W70-04742 02C

SNOW DENSITY
RELATIONSHIPS BETWEEN CLIMATE AND REGIONAL VARIATIONS IN SNOW-COVER DENSITY IN NORTH AMERICA,
W70-04742 02C

SNOWFIELDS
UTILITIES ON PERMANENT SNOWFIELDS,
W70-04740 03D

SNOWPACKS
RELATION OF SNOWPACK ACCUMULATION TO RED PINE STOCKING,
W70-04717 02C

SOCIAL NEEDS
NATIONAL POLICY PROBLEMS IN WATER RESOURCES.
W70-04978 06B

SOCIAL SCIENCES
CHAPTER II PERSPECTIVES ON MATHEMATICAL MODELS IN THE SOCIAL SCIENCES,
W70-04837 06A

SODIUM NITRATES
STABILIZATION PONDS IN THE CANNING INDUSTRY,
W70-04792 05D

SOIL
WATER TRANSFER FROM SOIL TO THE ATMOSPHERE AS RELATED TO CLIMATE AND SOIL PROPERTIES,
W70-04685 02G

SOIL CHEMICAL PROPERTIES
A STUDY OF THE EFFECT OF WATER QUALITY AND MANAGEMENT ON PHYSICAL AND CHEMICAL PROPERTIES OF SELECTED SOILS UNDER

IRRIGATION,
W70-04985 03C

SOIL CHEMISTRY
IONIC CONCENTRATION GRADIENTS IN PERMAFROST, BARROW, ALASKA,
W70-04736 02K

SOIL CONSERVATION
RESOURCE CONSERVATION GLOSSARY,
W70-04559 10

SOIL DENSITY
A DROP HAMMER PENETROMETER FOR DETERMINING THE DENSITY OF SOILS AND GRANULAR MATERIALS,
W70-04633 08D

SOIL EROSION
SOIL EROSION IN THE DETROIT METROPOLITAN AREA,
W70-04557 02J

SOIL FORMATION
THE PHYSICS AND MECHANICS OF SOIL,
W70-04631 08D

SOIL MECHANICS
THE PHYSICS AND MECHANICS OF SOIL,
W70-04631 08D

SOIL MOISTURE
MEASURING MOISTURE WITH GAMMA RADIATION,
W70-04641 08G

SOIL PHYSICAL PROPERTIES
A STUDY OF THE EFFECT OF WATER QUALITY AND MANAGEMENT ON PHYSICAL AND CHEMICAL PROPERTIES OF SELECTED SOILS UNDER IRRIGATION,
W70-04985 03C

SOIL PHYSICS
THE PHYSICS AND MECHANICS OF SOIL,
W70-04631 08D

SOIL PROPERTIES
EFFECTS OF REMOLDING ON THE PROPERTIES OF A LATERITIC SOIL,
W70-04632 08D

SOIL SURFACES
THE EFFECT OF ALBEDO ON THE EVAPOTRANSPIRATION RATE,
W70-04919 02D

SOIL SURVEYS
AIRPHOTO INTERPRETATION OF FLOOD PLAIN SOILS,
W70-04630 08D

W70-04630 08D

SOIL TESTS
A DROP HAMMER PENETROMETER FOR DETERMINING THE DENSITY OF SOILS AND GRANULAR MATERIALS,
W70-04633 08D

PRESSUREMETER CORRELATION STUDY,
W70-04634 08D

SOIL WATER
WATER TRANSFER FROM SOIL TO THE ATMOSPHERE AS RELATED TO CLIMATE AND SOIL PROPERTIES,
W70-04685 02G

A MODEL FOR SIMULATING SOIL WATER REGIME IN ALTERNATING FALLOW-CROP SYSTEMS,
W70-04920 02D

AN INDEX OF CROP WATER STRESS RELATED TO WHEAT AND GRAIN SORGHUM YIELDS,
W70-04924 02D

SOIL WATER MOVEMENT
FIELD MEASUREMENT OF SATURATED HYDRAULIC CONDUCTIVITY IN INITIALLY UNSATURATED SOIL,
W70-04607 02G

SOIL WATER RESERVES
A MODEL FOR SIMULATING SOIL WATER REGIME IN ALTERNATING FALLOW-CROP SYSTEMS,
W70-04920 02D

SOIL-WATER-PLANT RELATIONSHIPS
CHANGES IN CANOPY RESISTANCE TO WATER LOSS FROM ALFALFA INDUCED BY SOIL WATER DEPLETION,
W70-04921 02D

AN INDEX OF CROP WATER STRESS RELATED TO WHEAT AND GRAIN SORGHUM YIELDS,
W70-04924 02D

SOLAR RADIATION
THE ANNUAL MARCH OF THE TOPOCLIMATIC SPATIAL PATTERNS OF NET RADIATION IN SOUTHERN CALIFORNIA,
W70-04734 02B

NET AND SOLAR RADIATION RELATIONS OVER IRRIGATED FIELD CROPS,
W70-04922 02D

SOLID RETENTION TIME(SET)
ANAEROBIC TREATMENT OF SOLUBLE WASTES,
W70-04783 05D

SOLID WASTES
STABILIZATION PONDS IN THE CANNING INDUSTRY,
W70-04792 05D

SOLIDS CONTACT PROCESSES
NEW DEVELOPMENTS IN ANAEROBIC DIGESTION OF SLUDGES,
W70-04784 05D

SOLUBLE WASTES
ANAEROBIC TREATMENT OF SOLUBLE WASTES,
W70-04783 05D

SOLUTES
IONIC CONCENTRATION GRADIENTS IN PERMAFROST, BARROW, ALASKA,
W70-04736 02K

SOLVENT SCOURING
CURRENT PRACTICE IN SOLVENT SCOURING AND ITS FUTURE DEVELOPMENTS,
W70-04960 05D

SONIC-PULSE TEST
SONIC POLE TESTS PROVE RELIABLE AND INEXPENSIVE,
W70-04622 08C

SOUND WAVES
SONIC POLE TESTS PROVE RELIABLE AND INEXPENSIVE,
W70-04622 08C

SOURCES AND SINKS OF OXYGEN
ANALYSIS OF THE DISSOLVED OXYGEN VARIATION IN A FLOWING STREAM,
W70-04768 05D

SOUTH AUSTRALIA
EFFECTS OF MODERATE SHEEP STOCKING ON PLANT POPULATIONS OF A BLACK OAK-BLUEBUSH ASSOCIATION,
W70-04911 03F

SOUTH CAROLINA
FLOOD PLAIN INFORMATION, HORSE CREEK, AIKEN COUNTY, SOUTH CAROLINA.
W70-04738 04A

SOUTHWEST UNITED STATES
CONCEPTUAL DESIGN STUDIES OF A DUAL-PURPOSE AND A VAPOR-COMPRESSION WATER-ONLY 750-MGD PLANT,
W70-04683 03A

SOUTHWEST(US)
WASTE STABILIZATION POND PRACTICES IN THE UNITED STATES,
W70-04788 05D

SPECIES DIVERSITY
BIOLOGICAL RESPONSES TO NUTRIENTS-EUTROPHICATION SALINE WATER CONSIDERATIONS,
W70-04766 05D

SPECIES-DIVERSITY INDEX
ECOLOGICAL ASPECTS OF STREAM POLLUTION,
W70-04767 05D

SPILLWAYS
CHANGES OF THE WATER LEVEL OF LAKE BALATON FROM THE NEOLITHIC AGE UP TO THE PRESENT TIME,
W70-04755 02H

SPRAY IRRIGATION
DISPOSAL AND CLARIFICATION OF LIQUID WASTES,
W70-04968 05D

SPRAYED CONCRETE
LARGE AGGREGATE SHOTCRETE CHALLENGES STEEL RIBS AS A TUNNEL SUPPORT,
W70-04636 08F

SPRINGS
SPRINGS IN THE OZARK REGION, NORTHEASTERN OKLAHOMA,
W70-04594 02F

STABILITY
ECOLOGICAL ASPECTS OF STREAM POLLUTION,
W70-04767 05D

STABILIZATION
BASIS FOR WASTE STABILIZATION POND DESIGNS,
W70-04786 05D

ADVANCES IN ANAEROBIC POND SYSTEMS DESIGN,
W70-04787 05D

WASTE STABILIZATION POND PRACTICES IN THE UNITED STATES,
W70-04788 05D

WASTE STABILIZATION POND PRACTICES IN CANADA,
W70-04789 05D

EXTRA-DEEP PONDS,
W70-04790 05D

WASTE STABILIZATION PONDS FOR AGRICULTURAL WASTES,
W70-04791 05D

STABILIZATION PONDS IN THE CANNING INDUSTRY,
W70-04792 05D

WASTE TREATMENT IN THE MEAT PROCESSING INDUSTRY,
W70-04793 05D

WASTE STABILIZATION POND PRACTICES IN THE PULP AND PAPER INDUSTRY,
W70-04794 05D

NUMBERS AND TYPES OF MICROORGANISMS IN STABILIZATION POND EFFLUENTS,
W70-04819 05D

CHEMICAL STABILIZATION OF THE URANIUM TAILINGS AT TUBA CITY, ARIZONA,
W70-04888 05G

STABILIZATION BASINS OR LAGOONS
WASTE TREATMENT IN THE MEAT PROCESSING INDUSTRY,
W70-04793 05D

STABLE ISOTOPES
ISOTOPIC ABUNDANCE OF OXYGEN AND SULFUR IN SULFATE IONS FROM RIVER WATER,
W70-04715 02K

STAGE-DISCHARGE RELATIONS
ON THE SUBJECT OF A FLOOD PROPAGATION COMPUTATION METHOD (MUSKINGUM METHOD),
W70-04590 02E

STAGNANT WATER
MATHEMATICAL MODELING OF MIXING PHENOMENA IN RIVERS,
W70-04770 05D

STAINLESS STEEL
COMPARISON OF CHEMICALLY AND ELECTROLYTICALLY INDUCED PITTING CORROSION,
W70-04550 08G

STARCH
ANAEROBIC DIGESTION TREATS COTTON MILL DE-SIZE WASTES,
W70-04807 05D

STARCH WASTES
TEXTILE WASTE TREATMENT AT CANTON COTTON MILLS,
W70-04964 05D

STARCH-GLUTEN WASTE
PILOT INVESTIGATION OF STARCH-GLUTEN WASTE TREATMENT,
W70-04803 05D

STARCH-GLUTEN WASTE TREATMENT
PILOT INVESTIGATION OF STARCH-GLUTEN WASTE TREATMENT,
W70-04803 05D

STATE GOVERNMENTS
INDIANA WATER LAW AND SUGGESTIONS FOR ACTION,

FORECASTING MUNICIPAL WATER REQUIREMENTS, VOLUME I - THE MAIN II SYSTEM, VOLUME II - THE MAIN II SYSTEM USER'S MANUAL.
W70-04690 06D

MAIN I A SYSTEM OF COMPUTERIZED MODELS FOR CALCULATING AND EVALUATING MUNICIPAL WATER REQUIREMENTS -- ADDENDUM TO FINAL REPORT.
W70-04692 06D

WATER RESOURCES
AVAILABILITY OF GROUNDWATER FOR IRRIGATION IN CHEYENNE COUNTY, NEBRASKA,
W70-04596 02F

RECONNAISSANCE OF THE WATER RESOURCES OF THE FORT SMITH QUADRANGLE, EAST-CENTRAL OKLAHOMA,
W70-04601 02F

GEOLOGY AND GROUNDWATER RESOURCES OF LINN COUNTY, KANSAS,
W70-04732 02F

MANAGING THE GREAT LAKES WATER RESOURCE,
W70-04848 06B

THE WATER SITUATION,
W70-04914 03B

INTEGRATING REGIONAL WATER AND POWER SYSTEMS,
W70-04988 06A

WATER RESOURCES DEVELOPMENT
BIG BLUE RIVER BASIN.
W70-04603 02E

REGIONAL INTEGRATION OF SURFACE AND GROUNDWATER RESOURCES,
W70-04604 04B

INFORMATIONAL NEEDS ON CHANGES IN RURAL WATERSHEDS AND THEIR RELATIONSHIPS TO PLANNING ACTIVITIES,
W70-04724 04C

INDIANA WATER LAW AND SUGGESTIONS FOR ACTION,
W70-04868 06E

THE DISCOUNT RATE IN PUBLIC INVESTMENT EVALUATION PART I. VIEWS FROM THE ACADEMY.
W70-04903 06C

THE DISCOUNT RATE IN PUBLIC INVESTMENT EVALUATION, PART II VIEWS FROM THE FEDERAL GOVERNMENT A PANEL DISCUSSION,
W70-04904 06C

THE REGIONAL INTEREST IN WATERSHED MANAGEMENT,
W70-04913 04C

ESTHETIC INTERESTS IN WATER YIELD IMPROVEMENT,
W70-04917 03B

A DYNAMIC MODEL OF THE ECONOMY OF THE SUSQUEHANNA RIVER BASIN,
W70-04992 04A

DETERMINATION OF THE ECONOMIC CAPACITY OF STORAGE RESERVOIRS,
W70-05033 04A

WATER RESOURCES INFORMATION
SUPPLEMENT TO A PLAN FOR A COMPREHENSIVE WATER RESOURCES RESEARCH INFORMATION EXCHANGE SYSTEM,
W70-04693 10

WATER RESOURCES PLANNING ACT
NATIONAL POLICY PROBLEMS IN WATER RESOURCES.
W70-04978 06B

WATER RESOURCES RESEARCH ACT
RECOMMENDATIONS FOR WATERSHED RESEARCH PROGRAMS,
W70-04760 06B

WATER REUSE
ECONOMICS OF ARTIFICIAL RECHARGE FOR MUNICIPAL WATER SUPPLY,
W70-04614 04B

DILUTE SOLUTION REACTIONS OF THE NITRATE ION AS APPLIED TO WATER RECLAMATION,
W70-04652 05D

GROUNDWATER RECHARGE DESIGN FOR RENOVATING WASTE WATER,
W70-04712 05D

ECONOMICS OF RECLAIMED WATER IN DYEWORKS.
W70-04946 05D

WATER RIGHTS
INDIANA WATER LAW AND SUGGESTIONS FOR ACTION,
W70-04857 06E

W70-04865 06E

PRESENT AND PROPOSED LEGAL CONTROL OF WATER RESOURCES IN WISCONSIN (RIPARIAN RIGHTS AND SURFACE WATERS),
W70-04878 06E

PRESENT AND PROPOSED LEGAL CONTROL OF WATER RESOURCES IN WISCONSIN (DOCTRINE OF PRIOR APPROPRIATION),
W70-04879 06E

PRESENT AND PROPOSED LEGAL CONTROL OF WATER RESOURCES IN WISCONSIN (DIFFUSED SURFACE WATERS GROUNDWATER AND A PROPOSED WATER DIVERSION ACT),
W70-04880 06E

WATER SPREADING
FIELD MEASUREMENT OF SATURATED HYDRAULIC CONDUCTIVITY IN INITIALLY UNSATURATED SOIL,
W70-04607 02G

GROUNDWATER RECHARGE DESIGN FOR RENOVATING WASTE WATER,
W70-04712 05D

THE PRESENT AND FUTURE GROUNDWATER SUPPLY OF THE BATON ROUGE AREA,
W70-04856 04B

WATER STORAGE
INVESTIGATIONS ON WATER QUALITY AT ARTIFICIAL RECHARGE OF GROUNDWATER,
W70-04605 04B

STORAGE REQUIRED FOR DIFFERENT TYPES OF STREAM FLOW REGULATION,
W70-04744 04A

DETERMINATION OF THE REQUIRED RESERVOIR STORAGE FOR IRRIGATION UNDER THE CONDITIONS OF COMPENSATION DRAFT,
W70-04745 04A

EMPIRICAL METHOD FOR DETERMINATION OF STORAGE RESERVOIR CAPACITY,
W70-04759 04A

REPORT OF THE SELECT COMMITTEE ON WATER RESOURCES, (FLOOD PLAIN AREAS AND WATER STORAGE LANDS).
W70-04884 05G

THE IJSSEL LAKE AS A MULTI-PURPOSE RESERVOIR,
W70-05027 08A

ON THE SAFETY GIVEN BY A SEASONAL REGULATION RESERVOIR. (IN FRENCH),
W70-05028 04A

USING MAPS TO ESTIMATE THE TOTAL WATER STORAGE OF LITTLE RESERVOIRS OF A REGION. (IN FRENCH),
W70-05034 02E

WATER SUPPLY
URBAN EFFECTS ON WATER YIELD,
W70-04574 04C

THE GROUNDWATER HYDROLOGY OF THE LINCOLNSHIRE LIMESTONE,
W70-04733 02F

UTILITIES ON PERMANENT SNOWFIELDS,
W70-04740 03D

THE PRESENT AND FUTURE GROUNDWATER SUPPLY OF THE BATON ROUGE AREA,
W70-04856 04B

THE WATER SITUATION,
W70-04914 03B

WATER TEMPERATURE
PREDICTING THE EFFECT OF CLEARCUTTING ON STREAM TEMPERATURE,
W70-04556 04C

A DESCRIPTION OF THE SEASONAL THERMOCLINE CYCLE IN SHALLOW COASTAL WATER,
W70-04706 02L

AN OPTICAL AND HYDROGRAPHIC STUDY OF A TEMPERATURE INVERSION OFF OREGON DURING UPWELLING,
W70-04709 02L

WATER TRANSFER
THE REGIONAL INTEREST IN WATERSHED MANAGEMENT,
W70-04913 04C

WATER TREATMENT
CLARIFICATION OF TURBID WATER WITH POLYELECTROLYTES FOR RECHARGE THROUGH WELLS,
W70-04609 04B

WATER UTILIZATION
AN INVENTORY OF THE PONDS, LAKES, AND RESERVOIRS OF MASSACHUSETTS-BARNSTABLE COUNTY,
W70-04651 07C

QUANTITATIVE ANALYSIS OF RESIDENTIAL WATER-USE PATTERNS IN MAYAGUEZ, PUERTO RICO,
W70-04830 06D

CLIMATE AND ESTIMATED WATER USE BY AN ORANGE ORCHARD,
W70-04923 02D

OPTIMUM WATER USE - A MULTIDISCIPLINARY APPROACH,
W70-04986 06A

A DYNAMIC MODEL OF THE ECONOMY OF THE SUSQUEHANNA RIVER BASIN,
W70-04992 04A

WATER WELLS
A MATHEMATICAL MODEL OF AN EXISTING MUNICIPAL WELL FIELD,
W70-04619 02F

WATER YIELD IMPROVEMENT
THE RANGELANDS OF THE WESTERN U.S.,
W70-04907 03B

MANIPULATING VEGETATION FOR WATER CONSERVATION,
W70-04916 03B

ESTHETIC INTERESTS IN WATER YIELD IMPROVEMENT,
W70-04917 03B

WATERCOURSES(LEGAL)
INDIANA WATER LAW AND SUGGESTIONS FOR ACTION,
W70-04858 06E

WATERSHED MANAGEMENT
EFFECTS OF CONSERVATION TREATMENTS ON WATER YIELD,
W70-04730 03F

THE REGIONAL INTEREST IN WATERSHED MANAGEMENT,
W70-04913 04C

WATERSHEDS(BASINS)
YIELDS AND SOURCES OF NITROGEN FROM SEVERAL LAKE ONTARIO WATERSHEDS,
W70-04979 05B

WAVES(WATER)
ENERGY BALANCES FOR TRANSIENT WATER CRATERS,
W70-04562 01A

MEASURED WAVE FORCE DATA ON OFFSHORE PLATFORMS,
W70-04699 08B

ANALYSIS OF WAVE FORCE DATA,
W70-04700 08B

WAVE FORCES DATA ANALYSIS AND ENGINEERING CALCULATION METHOD,
W70-04702 08B

BANK FORMATION OF NEWLY ESTABLISHED RESERVOIRS,
W70-05022 04A

WEATHER FORECASTING
A GENERALIZED PROBABILITY MODEL FOR SEQUENCES OF WET AND DRY DAYS,
W70-04695 02B

FORECASTING SNOW AND RAIN FOR THE NEW YORK CITY AREA USING THE METHOD OF ORDERED STATISTICS,
W70-04720 02B

WEEDS
HERBICIDAL PROPERTIES OF SUBSTITUTED INDANS,
W70-04817 05B

WELLS
A MATHEMATICAL MODEL OF AN EXISTING MUNICIPAL WELL FIELD,
W70-04619 02F

WESTERN STATES WATER COUNCIL

PRESENT AND PROPOSED LEGAL CONTROL OF WATER RESOURCES IN WISCONSIN,
W70-04877 06E

PRESENT AND PROPOSED LEGAL CONTROL OF WATER RESOURCES IN WISCONSIN (RIPARIAN RIGHTS AND SURFACE WATERS),
W70-04878 06E

PRESENT AND PROPOSED LEGAL CONTROL OF WATER RESOURCES IN WISCONSIN (DOCTRINE OF PRIOR APPROPRIATION),
W70-04879 06E

PRESENT AND PROPOSED LEGAL CONTROL OF WATER RESOURCES IN WISCONSIN (DIFFUSED SURFACE WATERS GROUNDWATER AND A PROPOSED WATER DIVERSION ACT),
W70-04880 06E

WITHDRAWAL
LAND SUBSIDENCE RELATED TO GROUNDWATER OFFTAKE IN THE NEW ORLEANS AREA,
W70-04833 04B

WOOD PRESERVATIVES
INVESTIGATION OF A WOOD CURING WASTE,
W70-04805 05D

WOOD-POLE TRANSM LINES
SONIC POLE TESTS PROVE RELIABLE AND INEXPENSIVE,
W70-04622 08C

WOOD-WASTES
INVESTIGATION OF A WOOD CURING WASTE,
W70-04805 05D

WOOL
TREATMENT OF WOOL WASTES,
W70-04626 05D

THE PREVENTION OF WATER POLLUTION WITH SPECIAL REFERENCE TO SOME ASPECTS OF THE TEXTILE INDUSTRY,
W70-04799 05D

TREATMENT OF WOOL SCOURING WASTES WITH COLLOIDAL BENTONITE,
W70-04967 05D

WOOL DYEING WASTES
CHARACTERISTICS OF WOOL DYEING WASTES AND EXPERIMENTAL TREATMENT,
W70-04586 05D

WOOL GREASE
TREATMENT OF WOOL WASTES,
W70-04626 05D

NEW ZEALAND WOOL SCOURING LIQUORS - TREATMENT AND POTASSIUM RECOVERY,
W70-04897 05D

DEVELOPMENTS AND EQUIPMENT IN EFFLUENT TREATMENT,
W70-04977 05D

WOOL GREASE RECOVERY
A STUDY ON TREATMENT OF WOOL SCOURING LIQUORS,
W70-04743 05D

WOOL SCOURING
TRADE EFFLUENT CONTROL IN THE CARPET INDUSTRY,
W70-04625 05D

NEW ZEALAND WOOL SCOURING LIQUORS - TREATMENT AND POTASSIUM RECOVERY,

W70-04897 05D

WOOL-SCOURING WASTES
TREATMENT OF WOOL SCOURING WASTES WITH COLLOIDAL BENTONITE,
W70-04967 05D

WRIGHTSVILLE BEACH PLANT
CORROSION IN CARBON STEEL HEAT TRANSFER SURFACES,
W70-04680 03A

OPERATING EXPERIENCES AT THE OSW COAST TEST FACILITY, WRIGHTSVILLE BEACH, NORTH CAROLINA,
W70-04942 03A

WYOMING
ESTIMATE OF UNDERFLOW IN THE BIOBRARA RIVER BASIN ACROSS THE WYOMING-NEBRASKA STATE LINE,
W70-04593 02F

ZEOLITES
AMMONIA REMOVAL FROM AGRICULTURAL RUNOFF AND SECONDARY EFFLUENTS BY SELECTED ION EXCHANGE.
W70-04982 05D

ZONING
SHORELAND CORRIDOR REGULATIONS TO PROTECT LAKES,
W70-04820 02H

ZOOLGOEA RAMIGERA
FLOCCULATION PHENOMENA IN BIOLOGICAL SYSTEMS,
W70-04780 05D

ZOOPLANKTON
BIOLOGICAL RESPONSES TO NUTRIENTS-EUTROPHICATION SALINE WATER CONSIDERATIONS,
W70-04766 05D

VERTICAL DISTRIBUTION OF ZOOPLANKTON IN RELATION TO THE EASTERN PACIFIC OXYGEN MINIMUM,
W70-04815 05C

SEASONAL AND VERTICAL DISTRIBUTION OF THE ZOOPLANKTON IN THE ASKO AREA (NORTHERN BALTIC PROPER) IN RELATION TO HYDROGRAPHICAL CONDITIONS,
W70-04816 05C

PRODUCTIVITY OF PHYTOPLANKTON AND QUANTITIES OF ZOOPLANKTON AND BOTTOM FAUNA IN RELATION TO WATER QUALITY OF LAKE ASHTABULA RESERVOIR, NORTH DAKOTA,
W70-04855 02H

'BALAS' ALGORITHM
'BALAS' ALGORITHM FOR ZONED UNIFORM TREATMENT,
W70-04796 05D

'HOMOGENEOUS DIFFUSION MODEL'
KINETICS OF ADSORPTION BY ACTIVATED CARBON FROM DILUTE AQUEOUS SOLUTION,
W70-04798 05D

'PORE DIFFUSION MODEL'
KINETICS OF ADSORPTION BY ACTIVATED CARBON FROM DILUTE AQUEOUS SOLUTION,
W70-04798 05D

'ZONED UNIFORM TREATMENT'
'BALAS' ALGORITHM FOR ZONED UNIFORM TREATMENT,
W70-04796 05D

'ZONE-SETTLING'
LOW TEMPERATURE ACTIVATED SLUDGE SETTLING,
W70-04800 05D

LIBRARY
